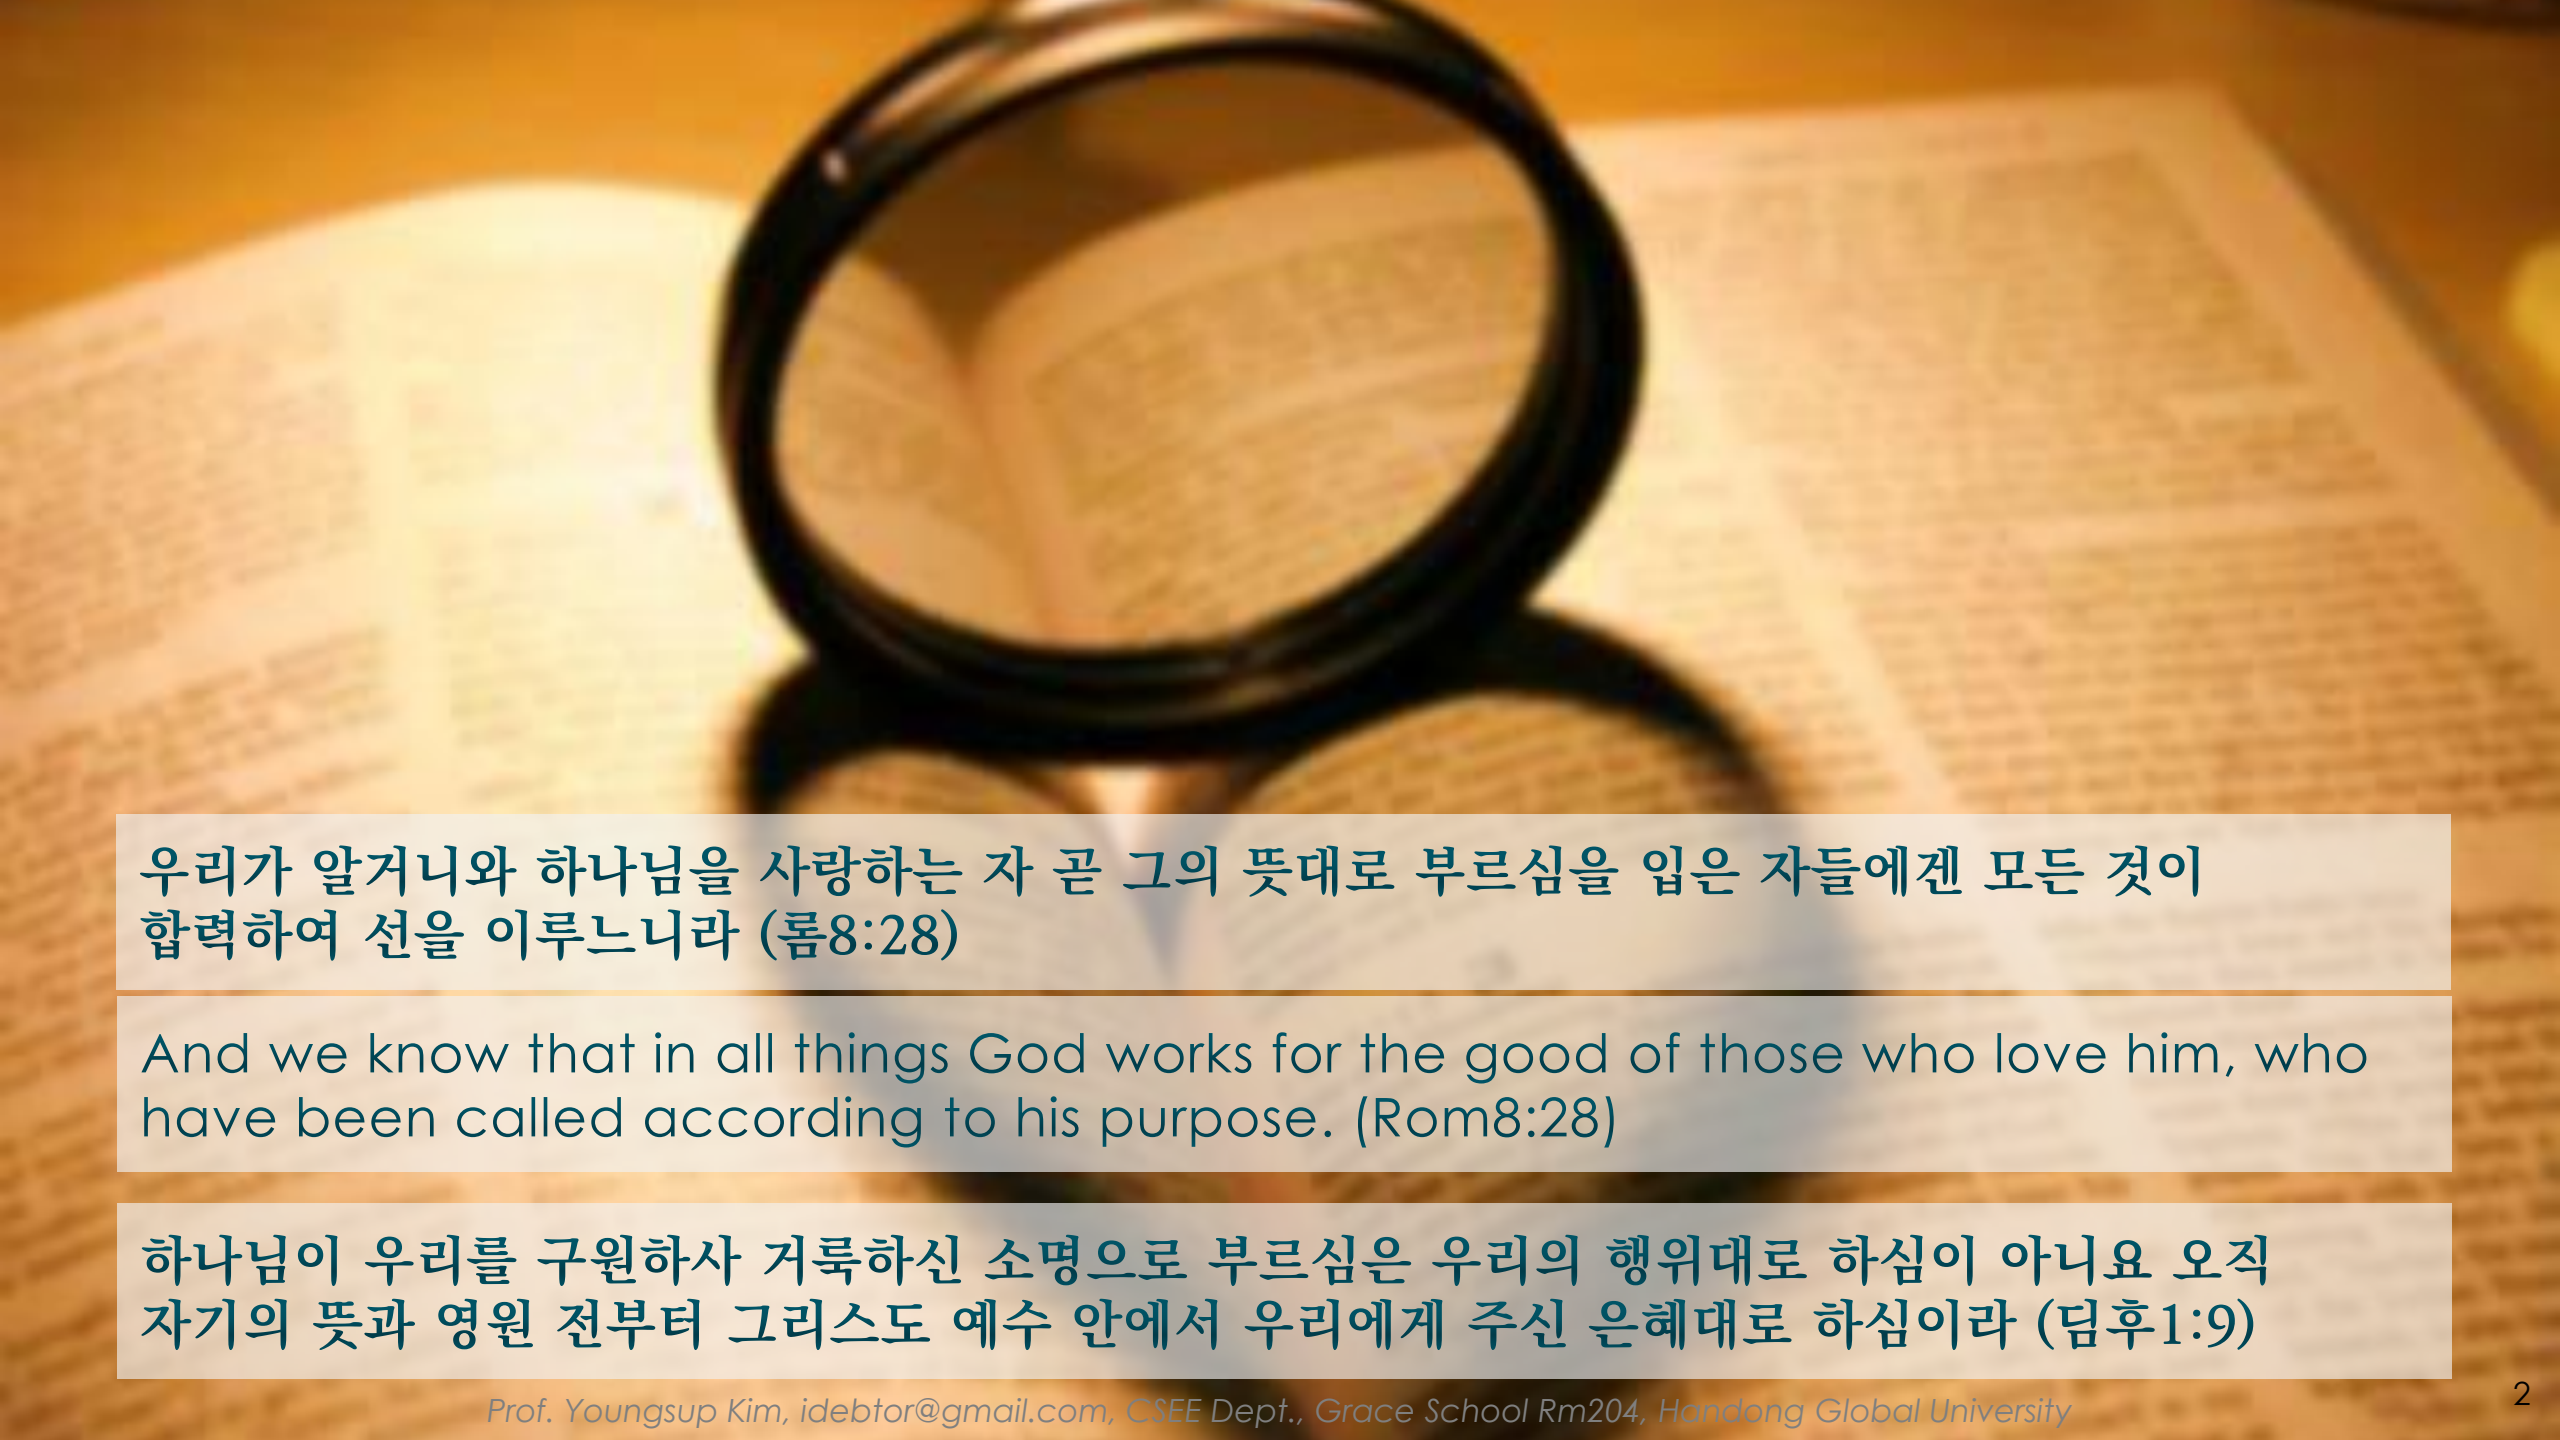
Data Structures
Chapter 4

1. Singly Linked List
2. Doubly Linked List
   - **Revisit – Singly Linked List**
   - **Sentinel Nodes & Basic Operations**
   - Two Key Operations: erase, insert
   - Advanced Operations

Prof. Youngsup Kim, idebtor@gmail.com, CSEE Dept., Grace School Rm204, Handong Global University



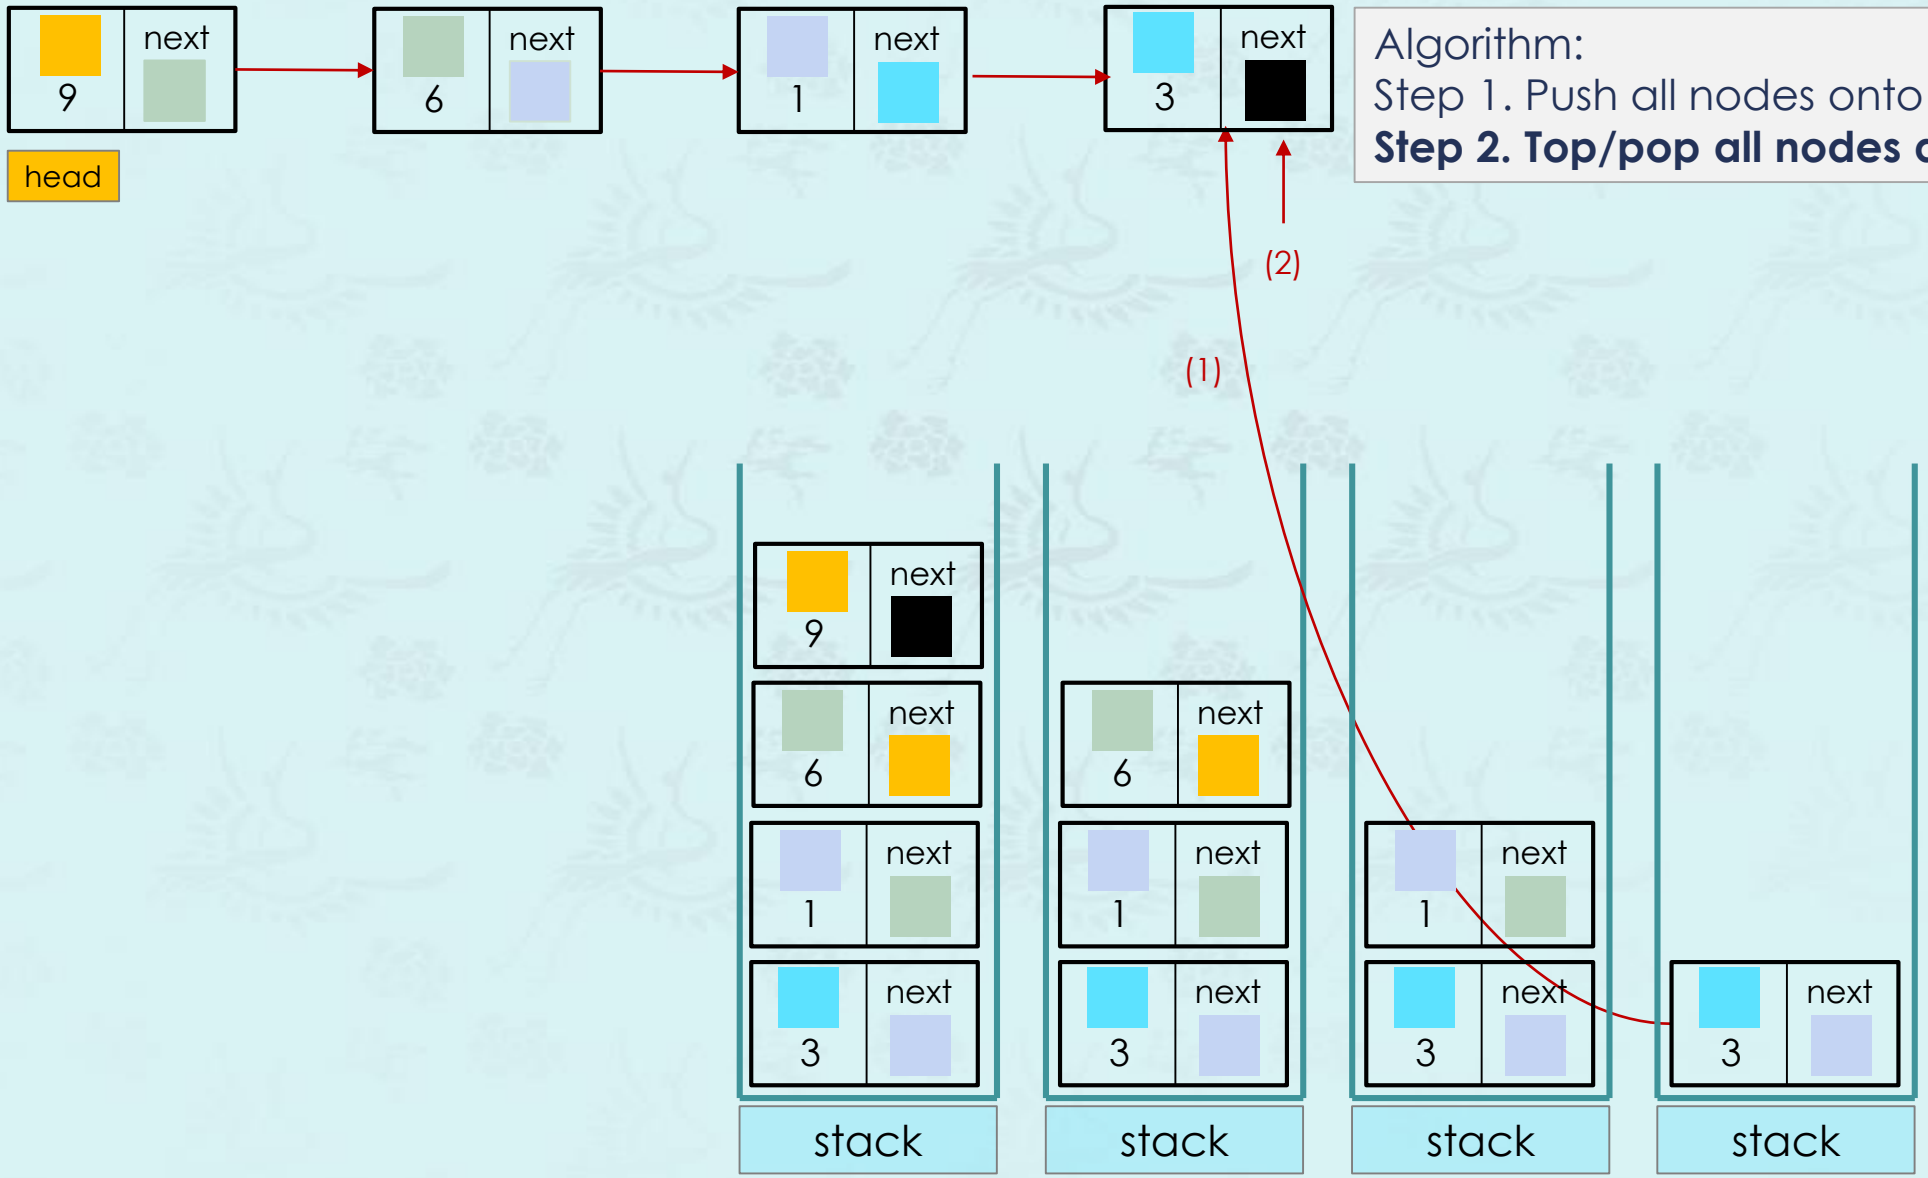
우리가 알거니와 하나님을 사랑하는 자 곧 그의 뜻대로 부르심을 입은 자들에겐 모든 것이 합력하여 선을 이루느니라 (롬8:28)

And we know that in all things God works for the good of those who love him, who have been called according to his purpose. (Rom8:28)

하나님이 우리를 구원하사 거룩하신 소명으로 부르심은 우리의 행위대로 하심이 아니요 오직 자기의 뜻과 영원 전부터 그리스도 예수 안에서 우리에게 주신 은혜대로 하심이라 (딤후1:9)

Linked List – reverse using stack

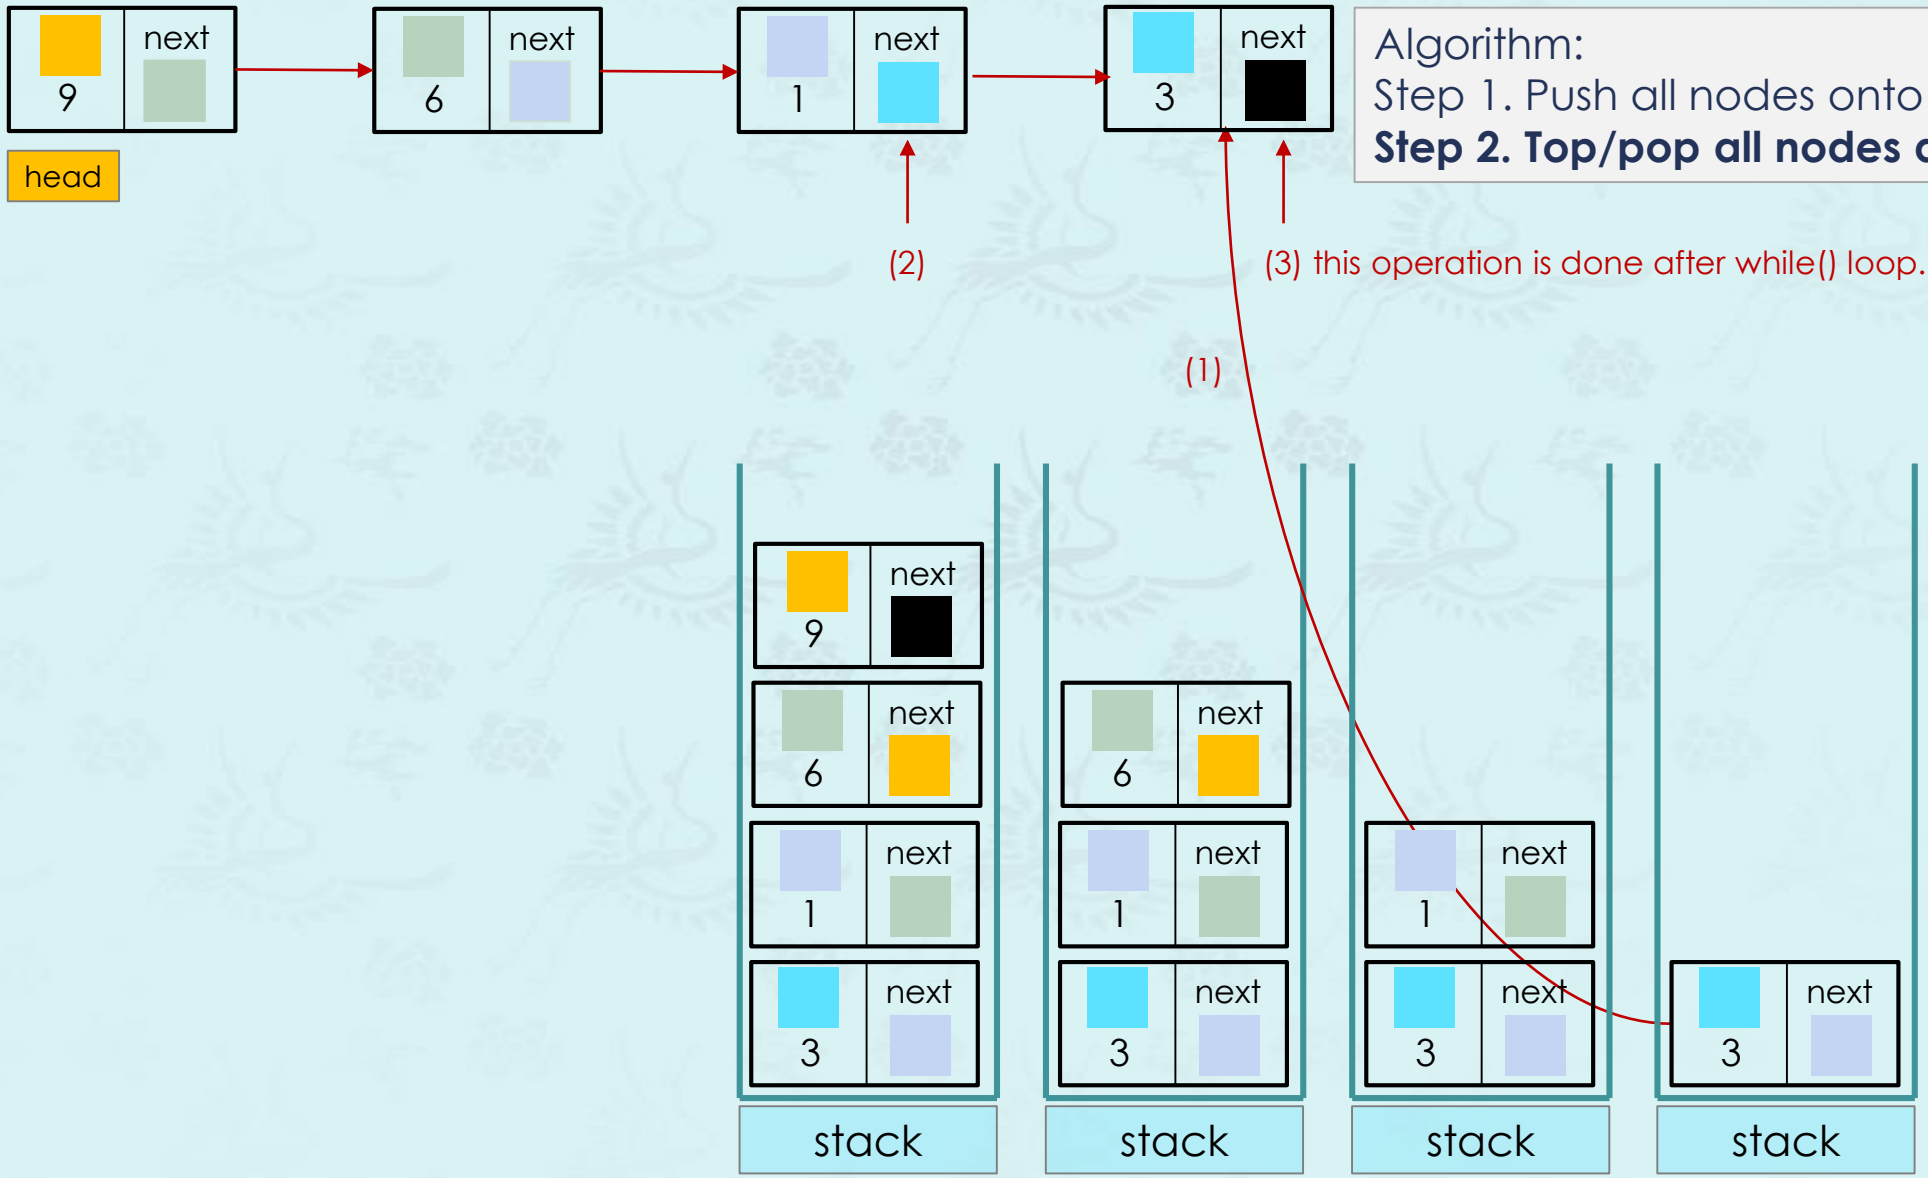
With an error



Algorithm:
Step 1. Push all nodes onto the stack.
Step 2. Top/pop all nodes and relink.

Linked List – reverse using stack

Corrected:



Algorithm:
Step 1. Push all nodes onto the stack.
Step 2. Top/pop all nodes and relink.

A Node and List Data Structure with Constructor and Destructor

```
struct Node {
  int    data;
  Node*  prev;
  Node*  next;
};

struct List {
  Node*  head;
  Node*  tail;
  int    size; //optional
};
using pNode = Node*;
using pList = List*;
```

unused in singly linked

```
struct Node {
  int     data;
  Node*   prev;
  Node*   next;
  Node(int d = 0, Node* p = nullptr,
                  Node* x = nullptr)
      { data = d; prev = p; next = x; }
  ~Node() {}
};

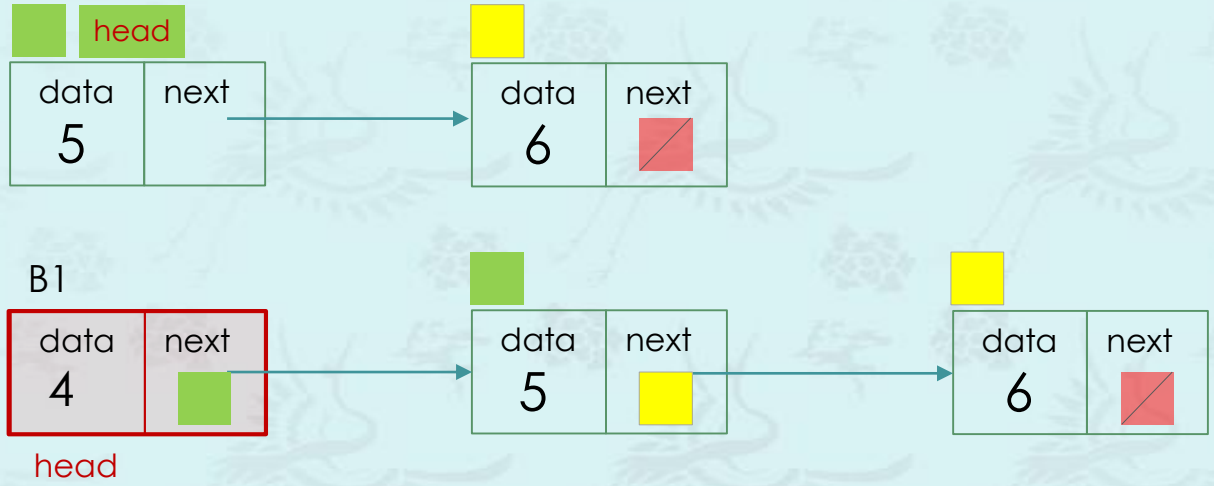
struct List {
  Node* head;
  Node* tail;
  int   size; // optional
  List() { head = new Node{}; tail = new Node{};
           head->next = tail; tail->prev = head;
           size = 0;
  }
  ~List() {}
};

using pNode = Node*;
using pList = List*;
```

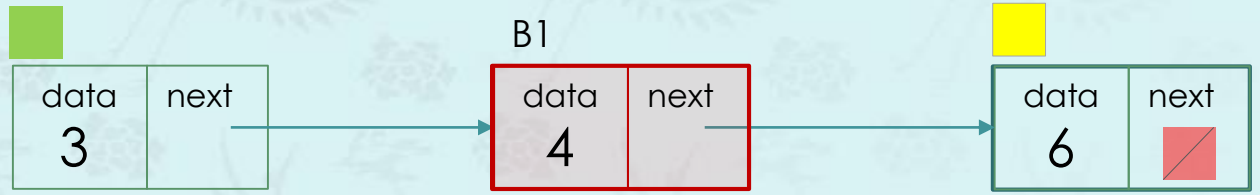
push a node – three different cases

Given: an data(4) to insert as sorted – What was the most difficult part of this coding?

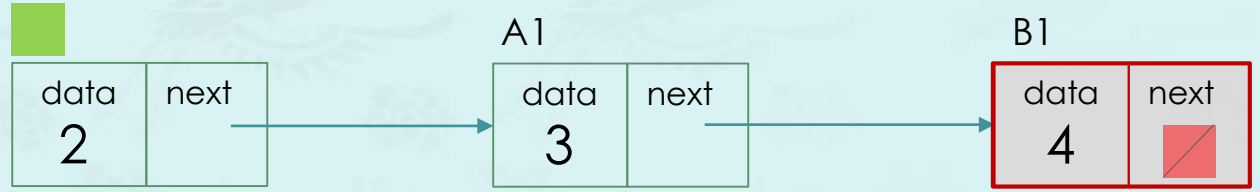
Case 1: in front



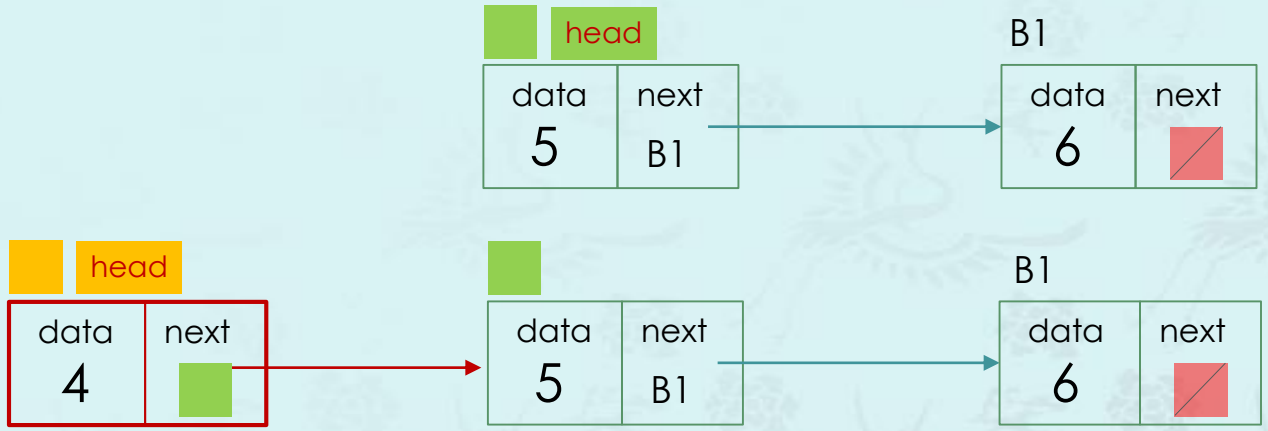
Case 2: in middle



Case 3: at end



push a node – **Case 1:** insert in front, head given



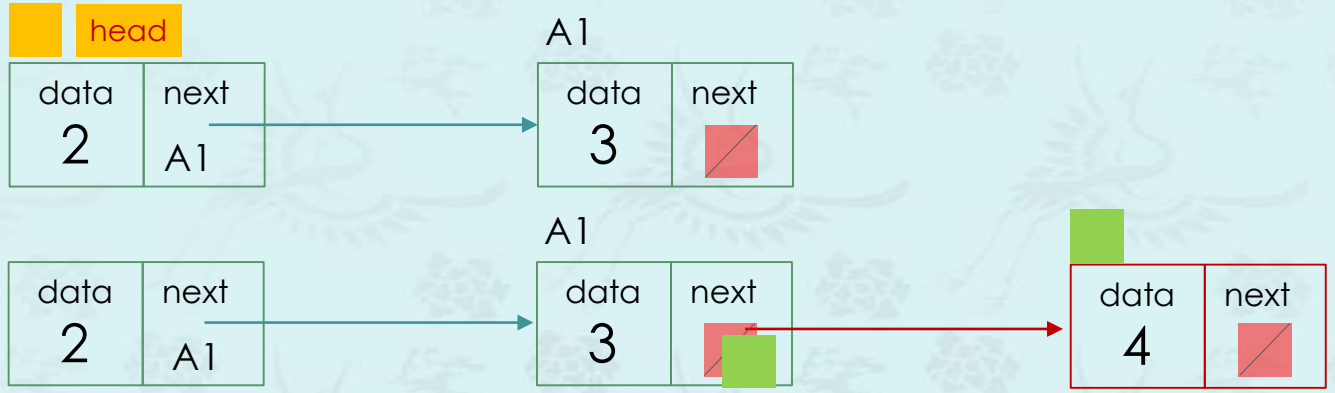
```
void push_front(pList p, int value) {
  p->head = new Node{value, p->head};
}
```

```
struct Node{
  int data;
  Node* next;
  Node(const int d = 0, pNode x = nullptr){
    data = d;        next = x;
  }
  ~Node() {}
};
```

```
struct List {
  Node*  head;
  Node*  tail;
  int    size; //optional
};
using pList = List*;
```

push a node – **Case 3**; insert at end, head given

Append a new Node{4}; then find the last node first to append.

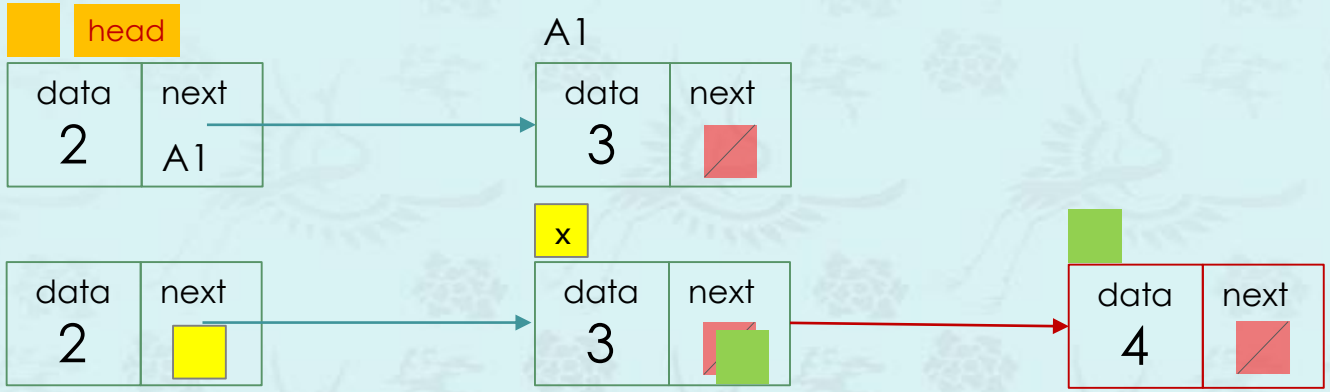


```
void push_back(pList p, int value) {

}
```

push a node – **Case 3**; insert at end, head given

Append a new Node{4}; then find the last node first to append.



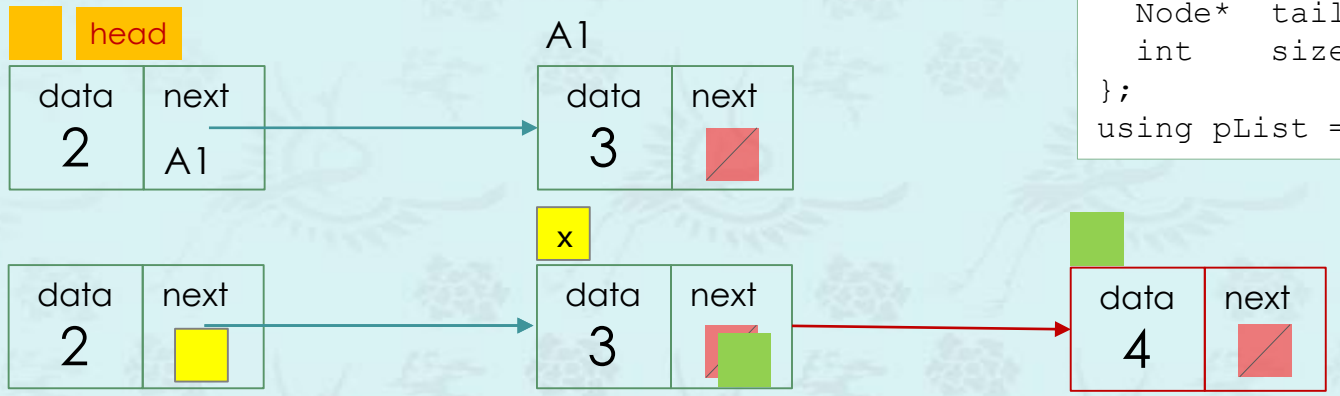
O(n)

```
void push_back(pList p, int value) {
  pNode x = last(p->head);
  x->next = new Node{ value, nullptr };
}
```

```
pNode last(pNode head)
 while (head->next != nullptr)
   head = head->next;
 return head;
```

push a node – **Case 3**; insert at end, head given

```
struct List {
  Node*  head;
  Node*  tail;
  int    size; //optional
};
using pList = List*;
```



O(n)

```
void push_back(pList p, int value) {
  pNode x = last(p->head);
  x->next = new Node{ value, nullptr };
}
```

```
pNode last(pNode head)
  while (head->next != nullptr)
    head = head->next;
  return head;
```

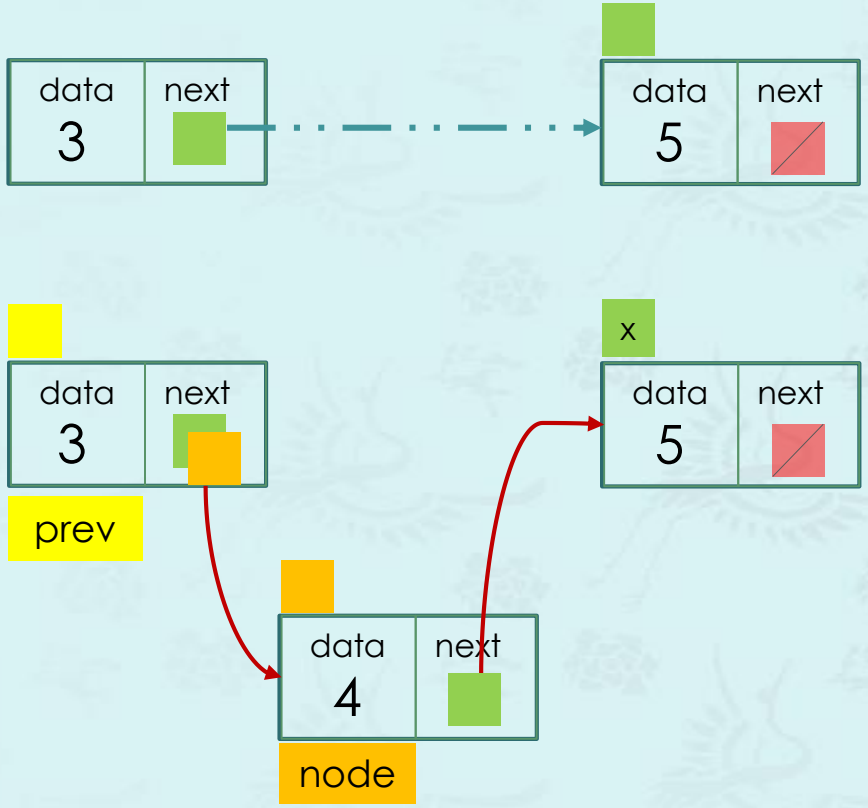
O(1)

```
void push_back(pList p, int value) {
  p->tail->next = new Node{ val };
  p->tail = p->tail->next;
}
```

it can be shortened

```
void push_back(pList p, int value) {
  p->tail = p->tail->next = new Node{ val };
}
```

push a node – **Case 2**; insert in middle, head given

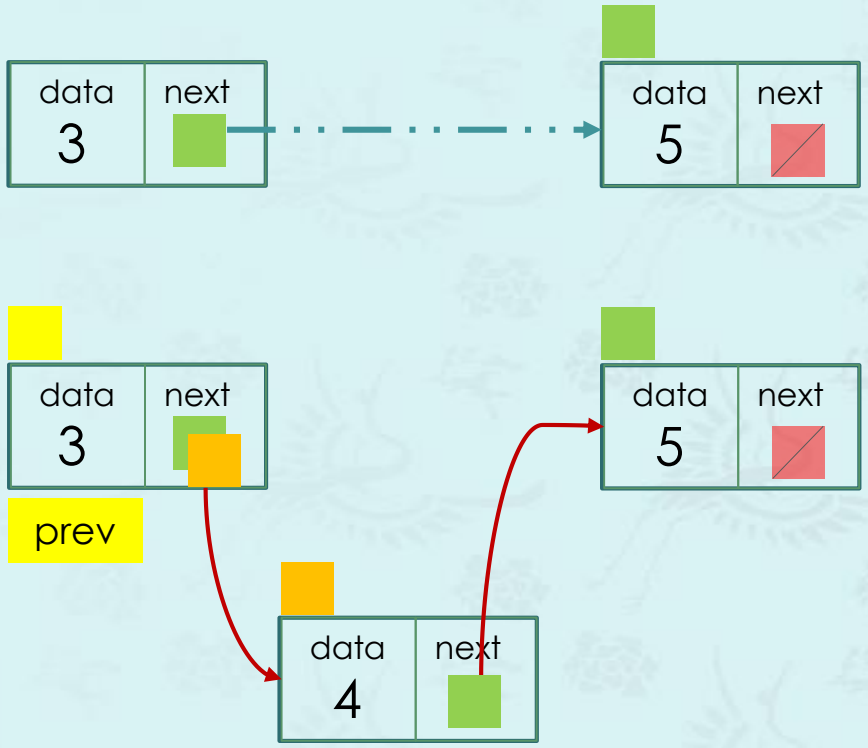


```
// inserts a node val at node z
void push_at(pList p, int value, int z) {
  if (empty(p) || (p->head->data == z) }
    return push_front(p, value);

  pNode x = p->head;
  pNode prev = nullptr;
  while (x != nullptr) {

    prev = x;
    x = x->next;
  }
}
```

push a node – **Case 2**; insert in middle, head given

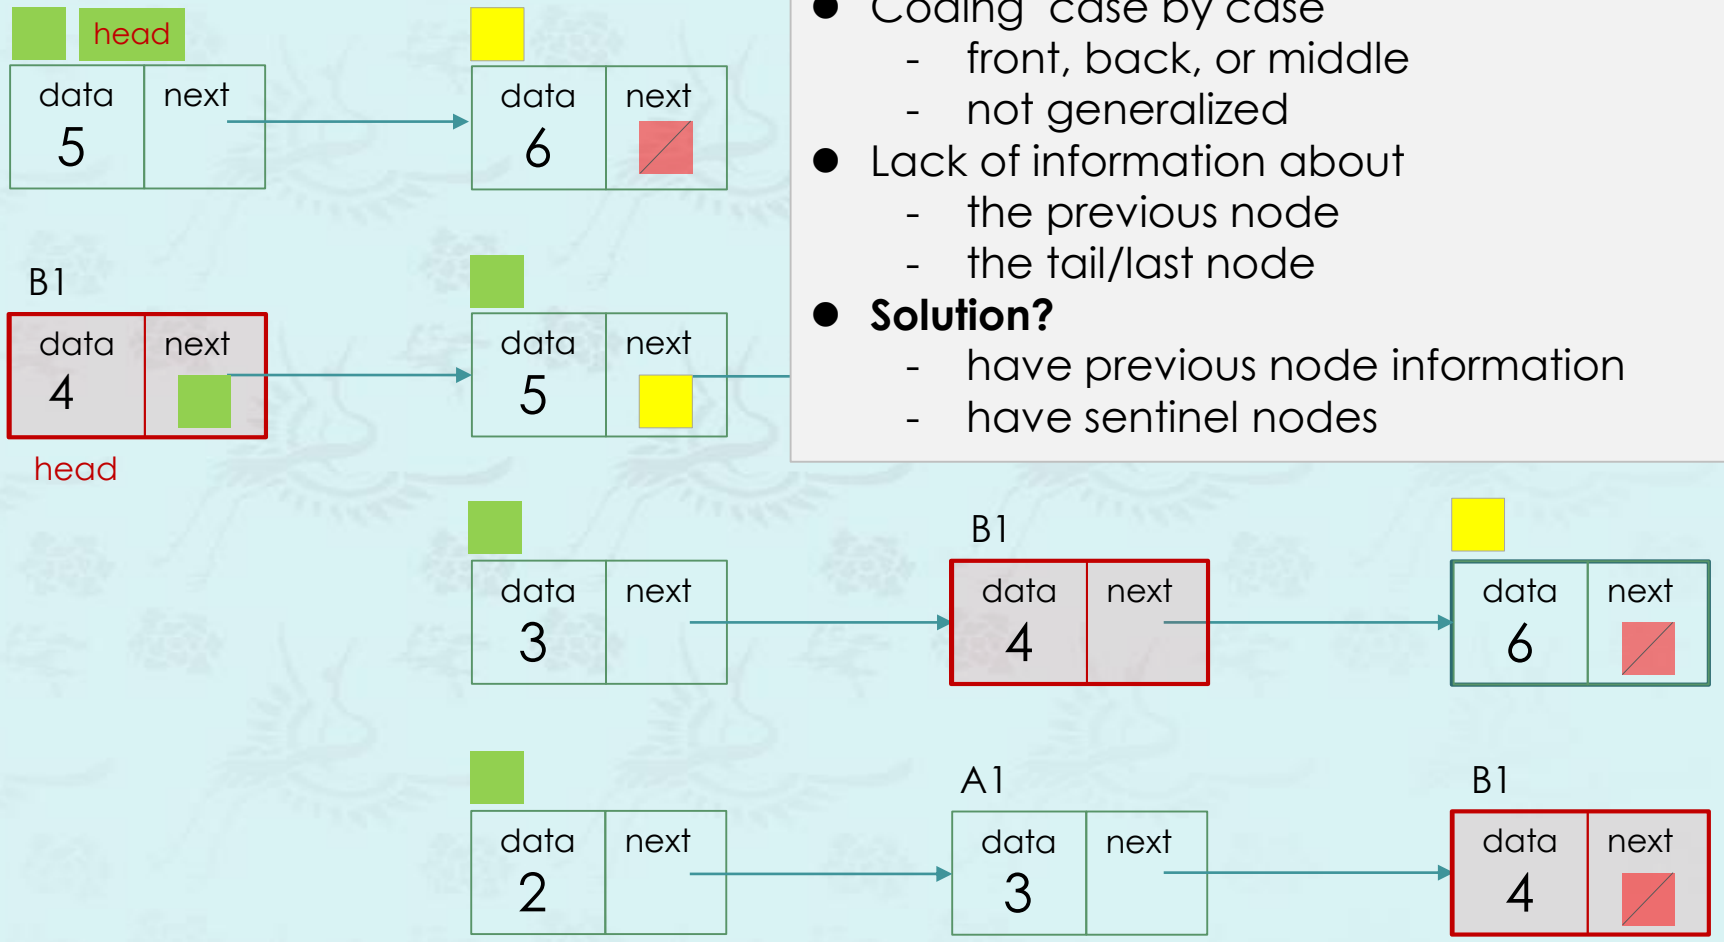


```
// inserts a node val at node z
void push_at(pList p, int value, int z) {
  if (empty(p) || (p->head->data == z) }
    return push_front(p, value);

  pNode x = p->head;
  pNode prev = nullptr;
  while (x != nullptr) {
    if (x->data == z) {
      prev->next = new Node{value, prev->next};
      return;
    }
    prev = x;
    x = x->next;
  }
}
```

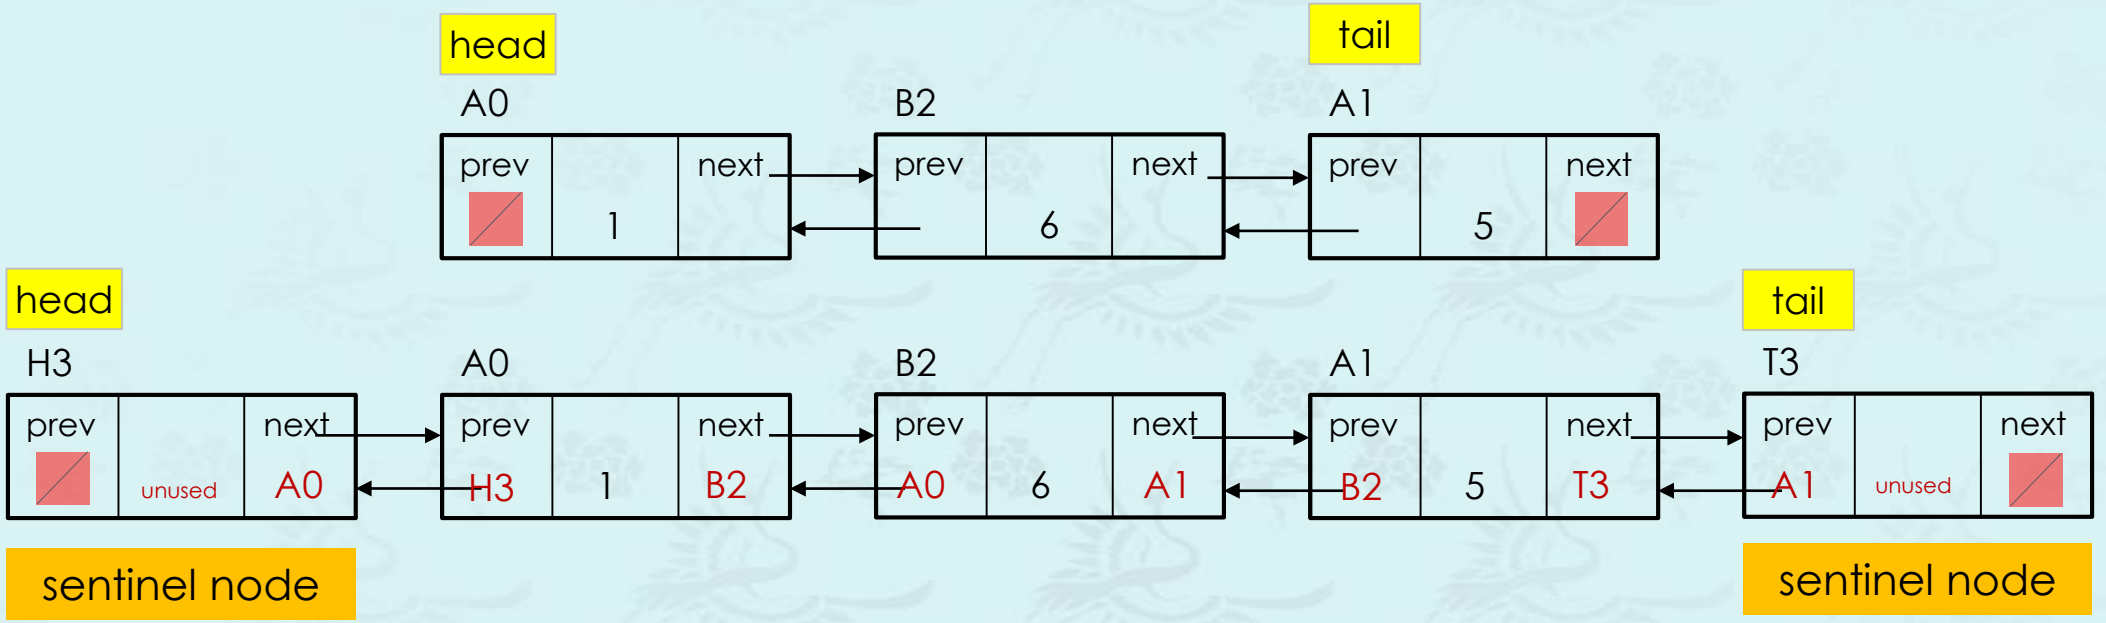
push a node – **Three different cases**

Given: an data(4) to insert – **What was the most difficult part of this coding?**



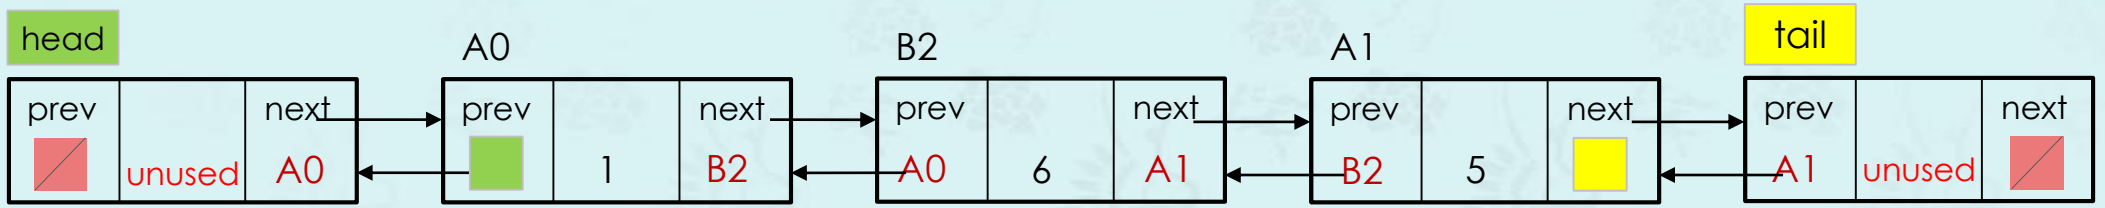
- Coding case by case
  - front, back, or middle
  - not generalized
- Lack of information about
  - the previous node
  - the tail/last node
- **Solution?**
  - have previous node information
  - have sentinel nodes

doubly linked list with sentinel nodes



- **Solution**
  - **doubly linked list with two sentinel nodes**
  - Each node carries the pointer to the previous node.
  - There is only one case (middle) with two sentinel nodes.

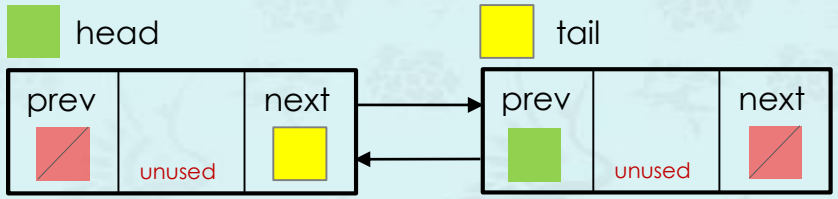
doubly linked list with sentinel nodes



- These extra nodes are known as **sentinel nodes.** The node at the front is known as **head node**, and the node at the end as a **tail node**. The head and tail nodes are created when the doubly linked list is initialized. The purpose of these nodes is to simply the insert, push/pop front and back, remove methods by eliminating all need for special-case code when the list empty, or when we insert at the head or tail of the list. This would **greatly** simplify the coding **unbelievably**.

- For instance, if we do not use a head node, then removing the first node becomes a special case, because we must reset the list's link to **the first node** during the remove and because the remove algorithm in general needs to access the node prior to the node being removed (and without a head node, the first node does not have a node prior to it).

doubly linked list with sentinel nodes

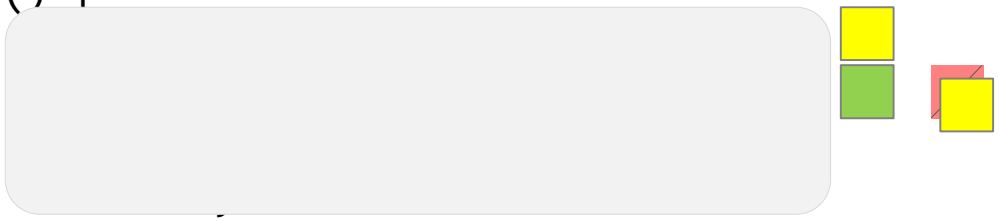


An **empty** doubly linked list with sentinel nodes

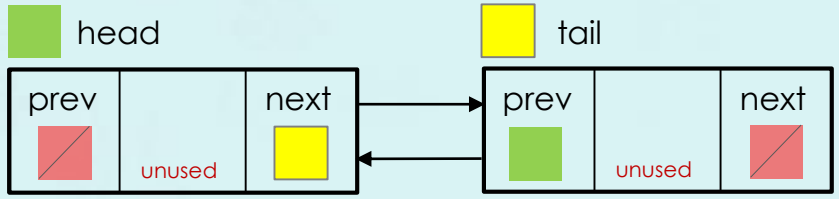
Initializing doubly linked list with sentinel nodes

```
struct Node {
  int     data;
  Node*   prev;
  Node*   next;
};

struct List {
  Node*   head;  //sentinel
  Node*   tail;  //sentinel
  int     size;  //size of list, optional
  List() {
  }
  ~List() {}
};
using pNode = Node*;
using pList = List*;
```



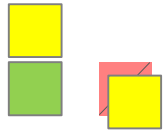
An **empty** doubly-linked list with sentinel nodes

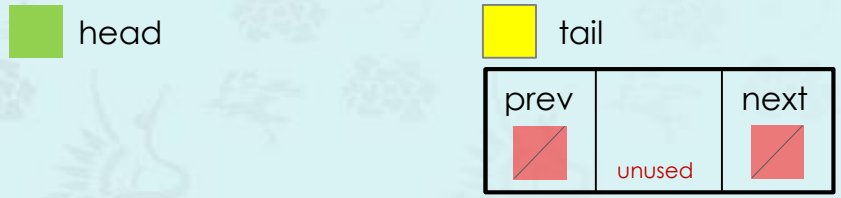


Initializing doubly linked list with sentinel nodes

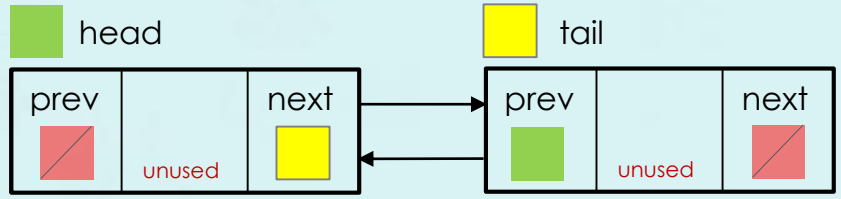
```
struct Node {
  int     data;
  Node*   prev;
  Node*   next;
};

struct List {
  Node*   head;  //sentinel
  Node*   tail;  //sentinel
  int     size;  //size of list, optional
  List() {
       tail = new Node{};
  }
  ~List() {}
};
using pNode = Node*;
using pList = List*;
```





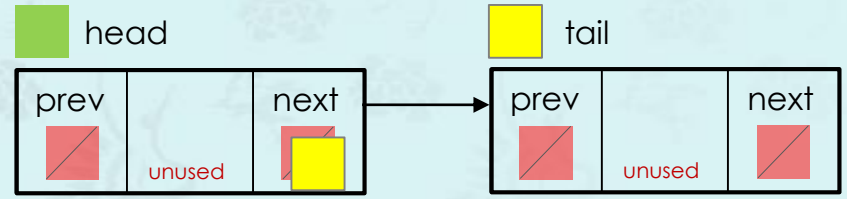
An **empty** doubly-linked list with sentinel nodes



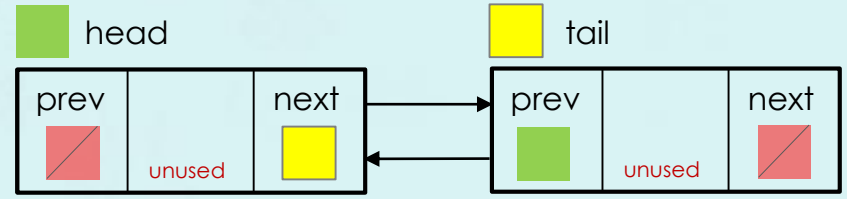
Initializing doubly linked list with sentinel nodes

```
struct Node {
  int     data;
  Node*   prev;
  Node*   next;
};

struct List {
  Node*   head;  //sentinel
  Node*   tail;  //sentinel
  int     size;  //size of list, optional
  List() {
       tail = new Node{};
       head = new Node{0, nullptr, tail};
  }
  ~List() {}
};
using pNode = Node*;
using pList = List*;
```



An **empty** doubly-linked list with sentinel nodes



Initializing doubly linked list with sentinel nodes

```
struct Node {
  int     data;
  Node*   prev;
  Node*   next;
};

struct List {
  Node*   head;  //sentinel
  Node*   tail;  //sentinel
  int     size;  //size of list, optional

  }
  ~List() {}
};

using pNode = Node*;
using pList = List*;
```

another way of doubly linked list initialization

An **empty** doubly-linked list with sentinel nodes

Basic Operations:

```
pNode begin(pList p) {
  return p->head->next;
}
```

What is the name of this function?

```
pNode end(pList p) {
  return p->tail;
}
```

What is the name of this function?

Basic Operations: begin() and end()

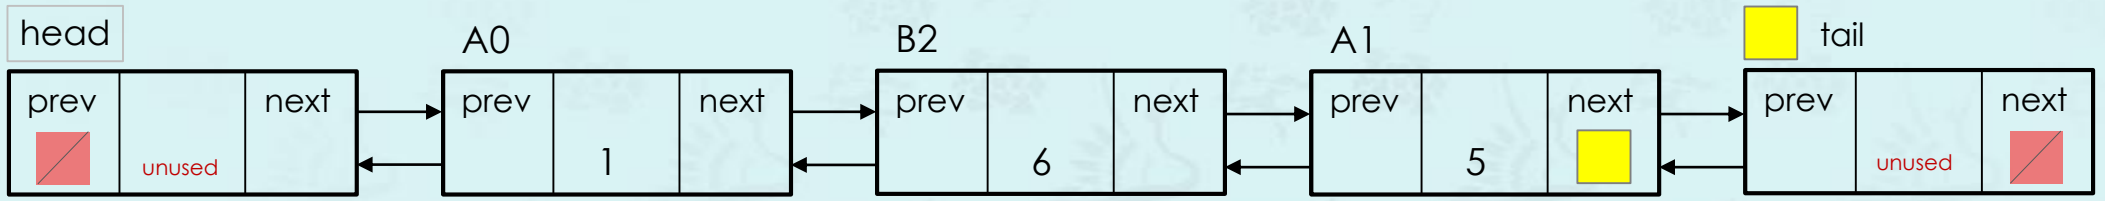
```
// returns the first node which list::head points to in the container.
pNode begin(pList p) {
  return p->head->next;
}
```

```
// returns the tail node referring to the past -the last- node in the list.
// The past -the last- node is the sentinel node which is used only as a sentinel that would
// follow the last node. It does not point to any node next, and thus shall not be dereferenced.
// Because the way we are going use during the iteration, we don't want to include the node
// pointed by this. This function is often used in combination with List::begin to specify a
// range including all the nodes in the list. This is a kind of simulated used in STL. If the
// container is empty, this function returns the same as List::begin.

pNode end(pList p) {
  return p->tail;
}
```

With the container given below, what does begin(p) and end(p) return in mnemonic code, respectively?

Basic Operations:



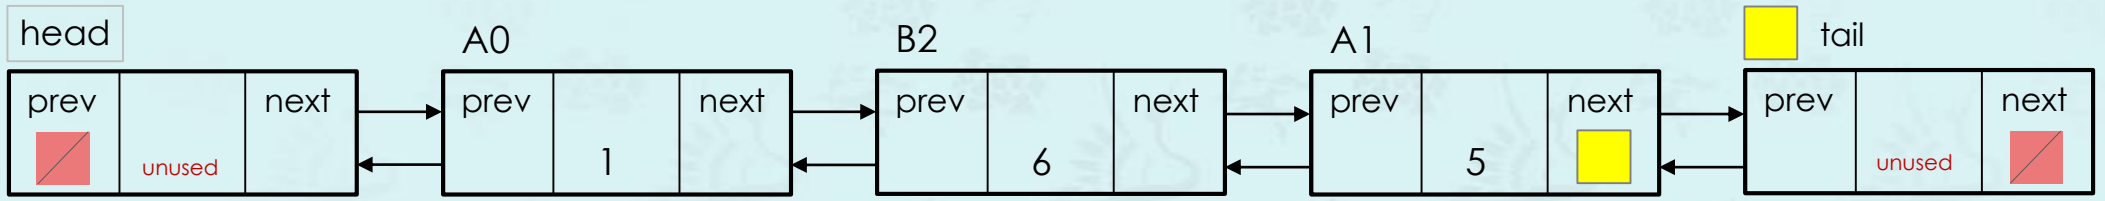
```
pNode begin(pList p) {
  return p->head->next;
}
```

What is the return value of begin() in mnemonic shown above?

```
pNode end(pList p) {
  return p->tail;
}
```

What is the return value of begin() in mnemonic shown above?

Basic Operations:

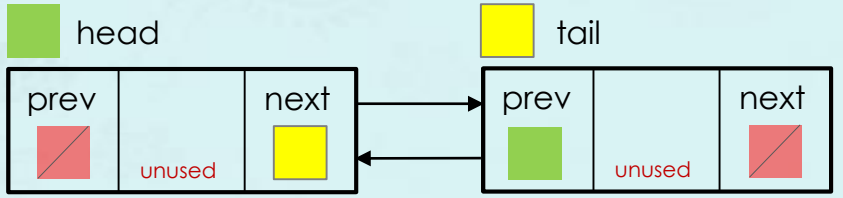


```
pNode begin(pList p) {
  return p->head->next;
}
```

```
bool empty(pList p) {
  return begin(p) == end(p);
}
```

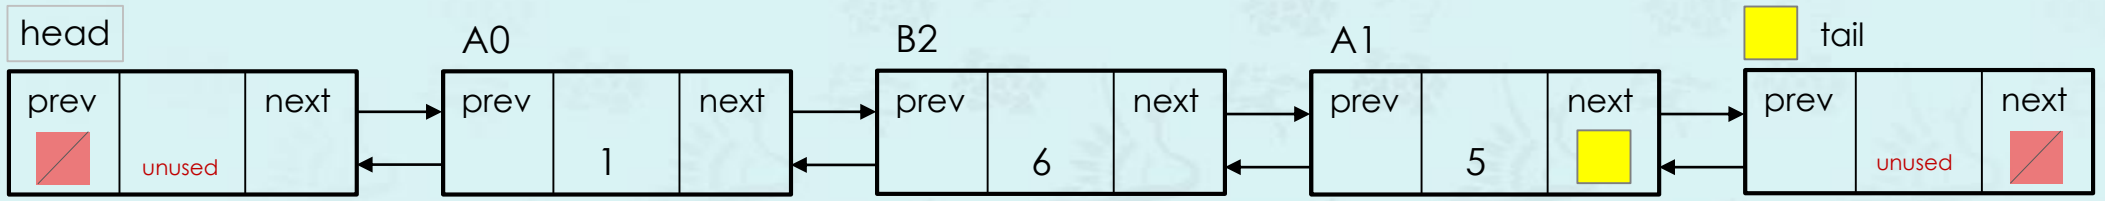
```
pNode end(pList p) {
  return p->tail;
}
```

```
pNode last(pList p) {
  return end(p)->prev;
}
```



An **empty** doubly-linked list with sentinel nodes

Basic Operations:

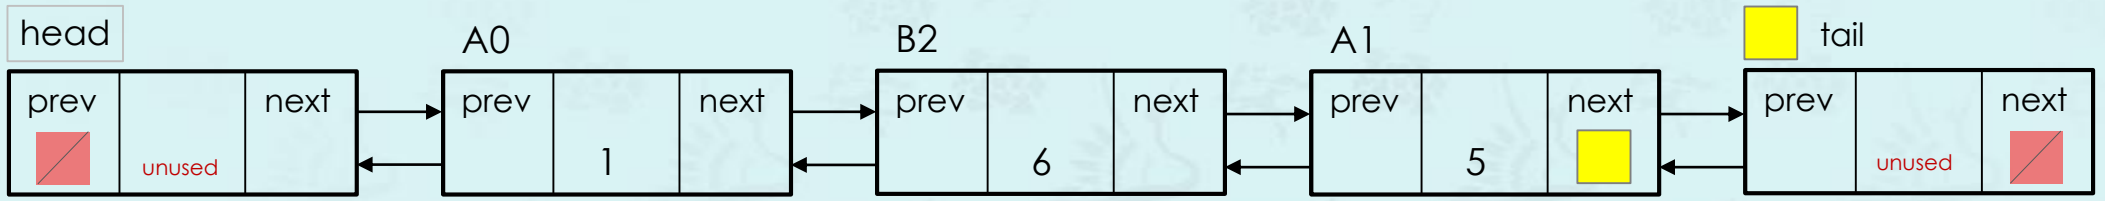


```
int size(pList p) {
  int count = 0;

  return count;
}
```

```
int size(pList p) {
  int count = 0;
  pNode x = begin(p);
  while(x != end(p)) {
    count++;
    x = x->next;
  }
  return count;
}
```

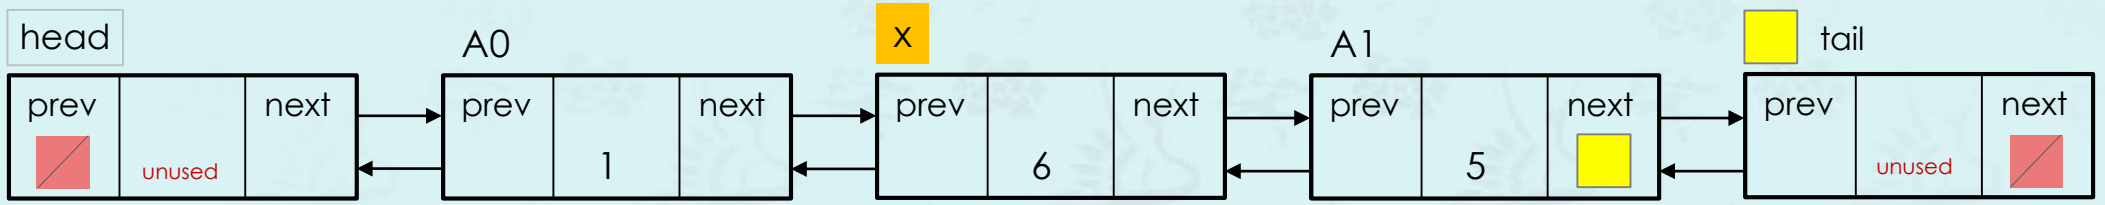
Basic Operations:



```
int size(pList p) {
  int count = 0;
  for (pNode x = begin(p); x != end(p); x = x->next)
    count++;
  return count;
}
```

```
int size(pList p) {
  int count = 0;
  pNode x = begin(p);
  while(x != end(p)) {
    count++;
    x = x->next;
  }
  return count;
}
```

Basic Operations:

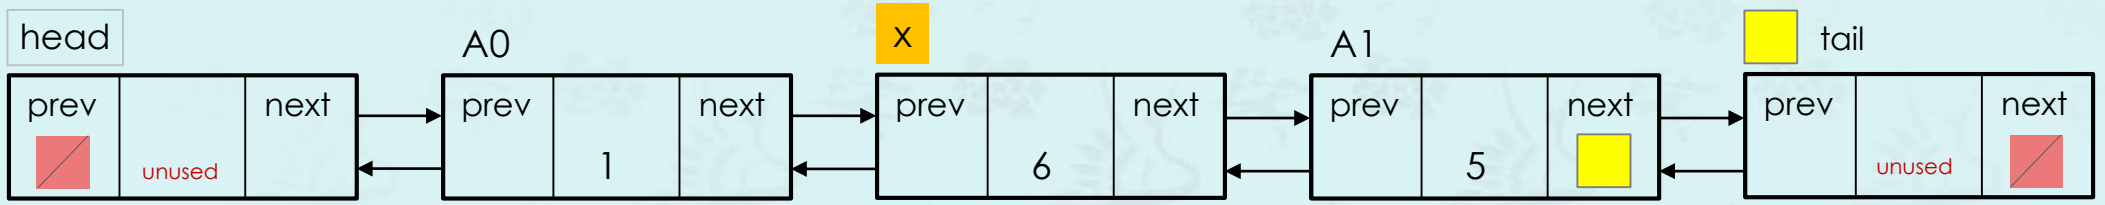


```
int find(pList p, int value) {
  for (pNode x = begin(p); x != end(p); x = x->next)
    if (x->data == value) return x;
  return x;
} // there is a bug.
```

```
int find(pList p, int value) {
  pNode x = begin(p);
  for ( ; x != end(p); x = x->next)
    if (x->data == value) return x;
  return x;
}
```

```
pNode find(pList p, int value){
  pNode x = begin(p);
  while(x != end(p)) {
    if (x->data == value) return x;
    x = x->next;
  }
  return x;
}
```

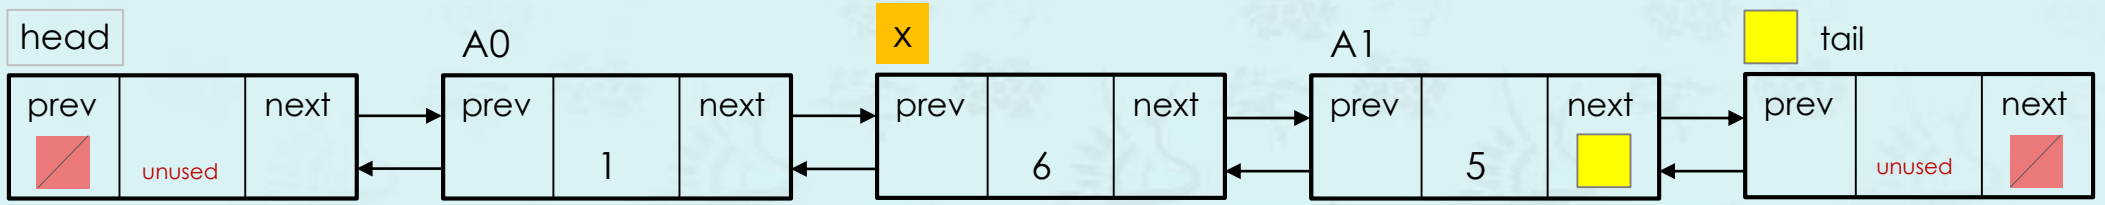
Basic Operations:



- What does it return if not found? ⟶
  (1) A1, (2) tail, (3) nullptr.

```
pNode find(pList p, int value){
  pNode x = begin(p);
  while(x != end(p)) {
    if (x->data == value) return x;
    x = x->next;
  }
  return x;
}
```

Basic Operations:



```
pNode find(pList p, int value){
  pNode x = begin(p);

  return x;
}
```

```
pNode find(pList p, int value){
  pNode x = begin(p);
  while(x != end(p)) {
    if (x->data == value) return x;
    x = x->next;
  }
  return x;
}
```

- Can we reduce the number lines by two? →

x->prev->next ==
x->next->prev ==
      x->prev ==
      x->next ==
```

```
void erase(pNode x){
  x->prev->next = x->next;
  x->next->prev = x->prev;
  delete x;
} //stay tuned for the better
```

Pop by value

- Implement `pop()` using `erase()` and `find()`.

```
void pop(pList p, int value){
  pNode node = find(p, value);
  erase(node);
}
```

```
void erase(pNode x){
  x->prev->next = x->next;
  x->next->prev = x->prev;
  delete x;
} //stay tuned for the better
```

```
pNode find(pList p, int value)
```

Pop by value

- Implement `pop()` using `erase()` and `find()`.

```
void pop(pList p, int value){
  pNode node = find(p, value);
  erase(node);
}
```

```
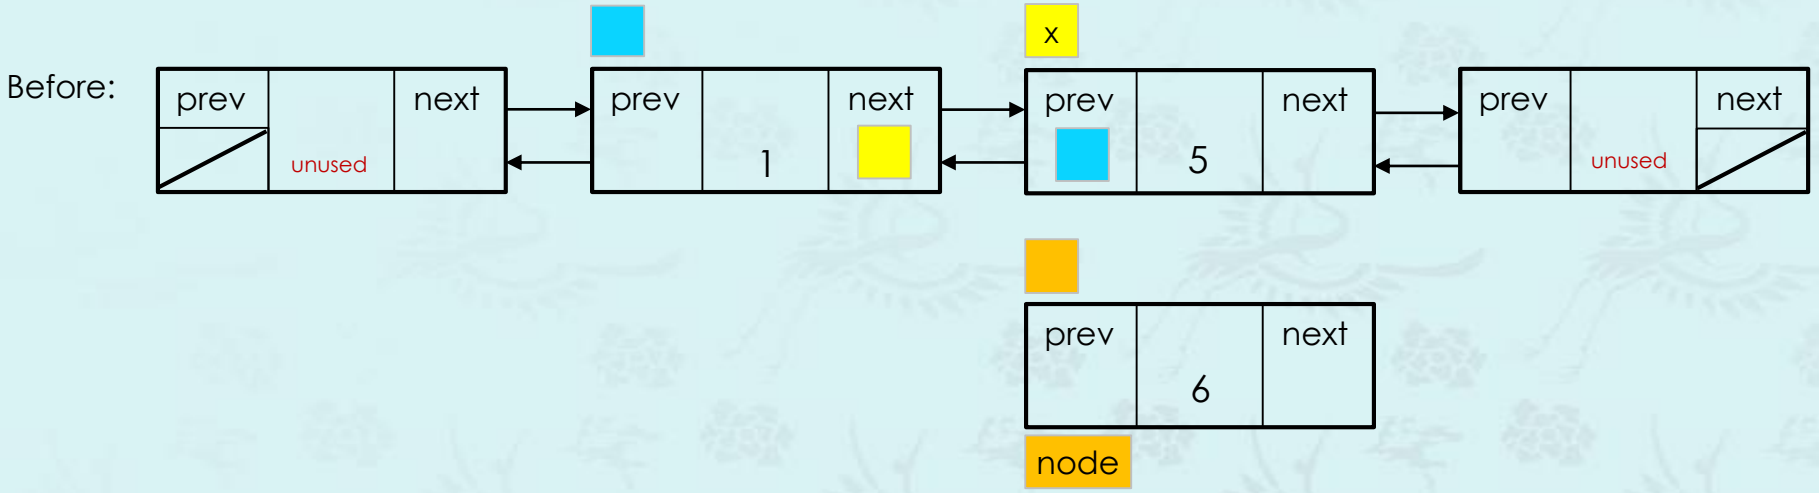
void pop(pList p, int value){
  erase(find(p, value));
}
```
//stay tuned

This code may not work some cases?
How can you fix it?

```
void erase(pNode x){
  x->prev->next = x->next;
  x->next->prev = x->prev;
  delete x;
} //stay tuned for the better
```

```
pNode find(pList p, int value)
```

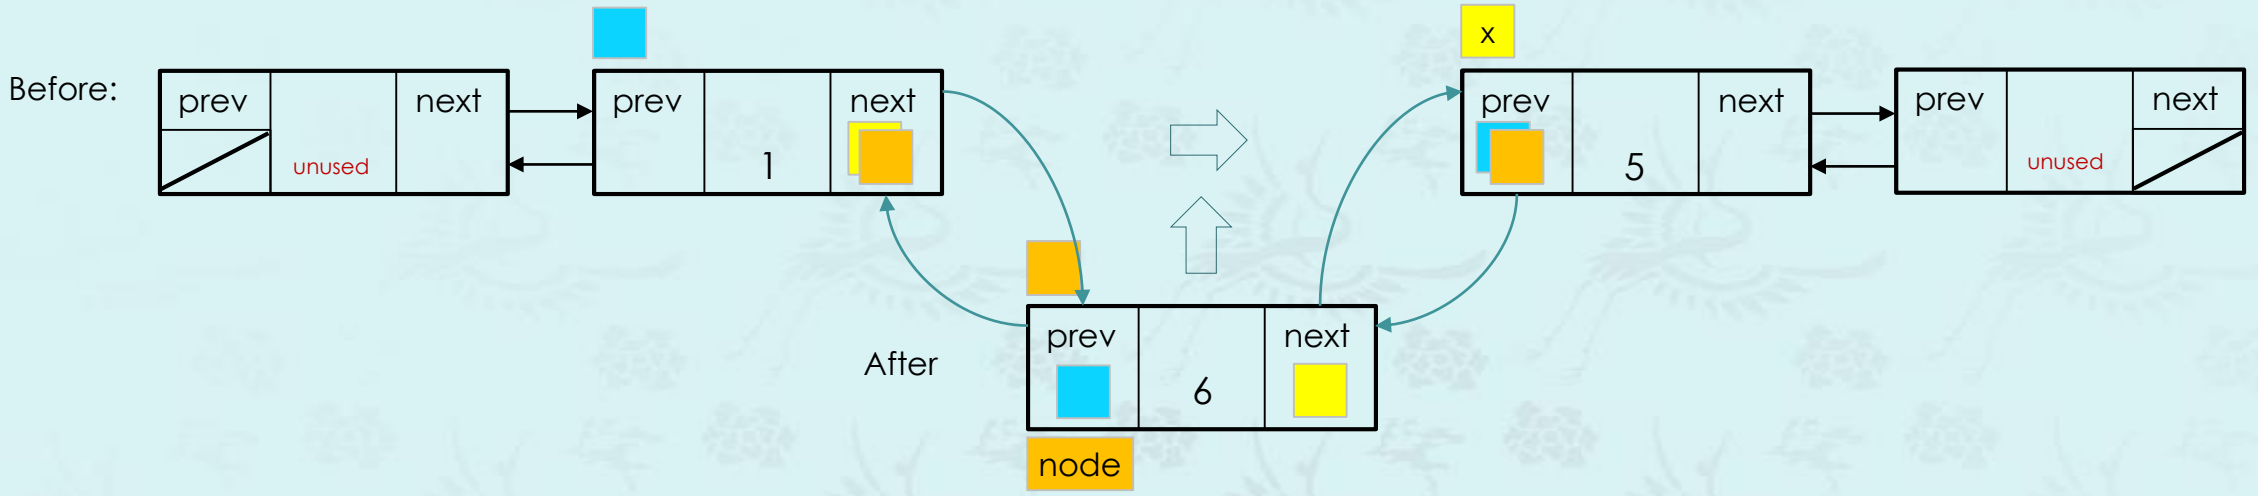
Key Operations: Insert a new node(value) **in place of the node x**



```
void insert(pNode x, int value){

}
```

Key Operations: Insert a new node(value) **in place of the node x**



Before:

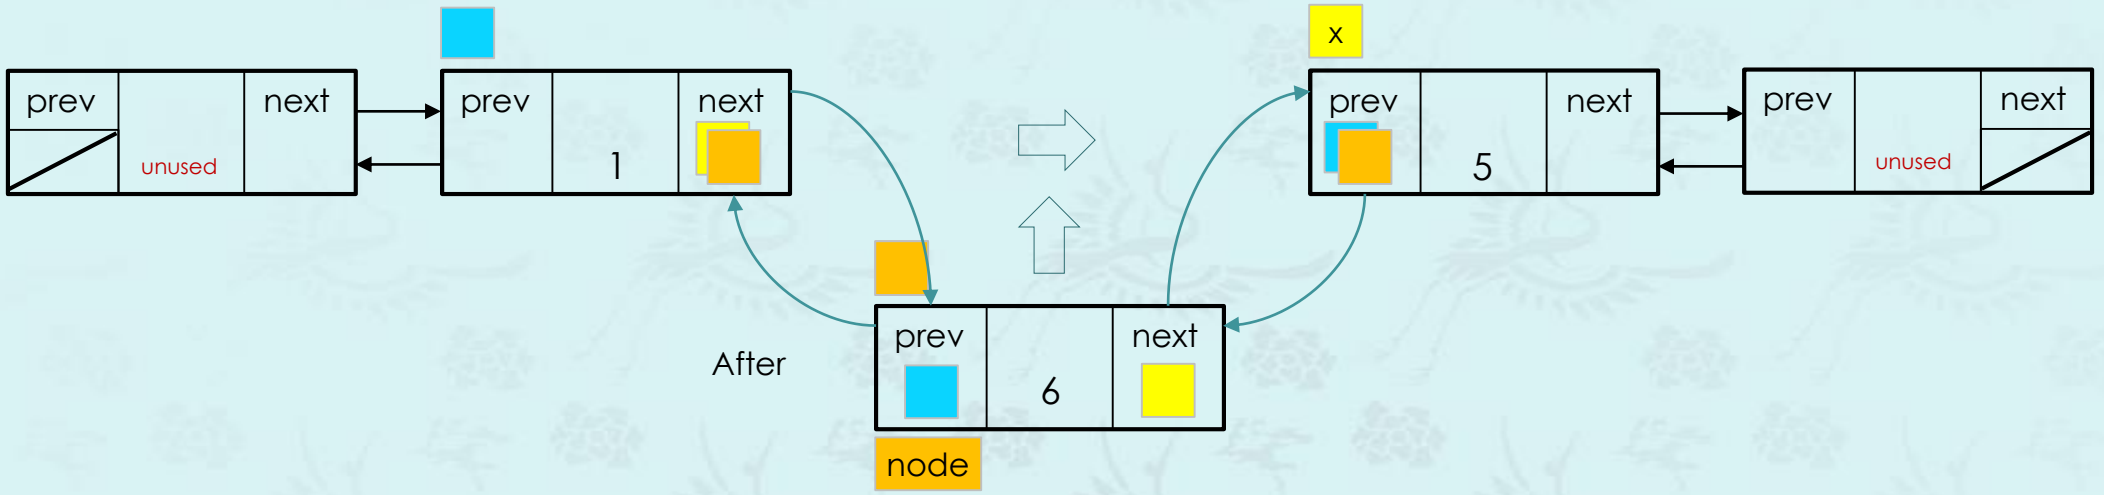
```
              x == x
x->prev->next ==
      x->prev ==
```

Express each color code in terms of x.

```
void insert(pNode x, int value){

}
```

Key Operations: Insert a new node(value) **in place of the node x**



Before:

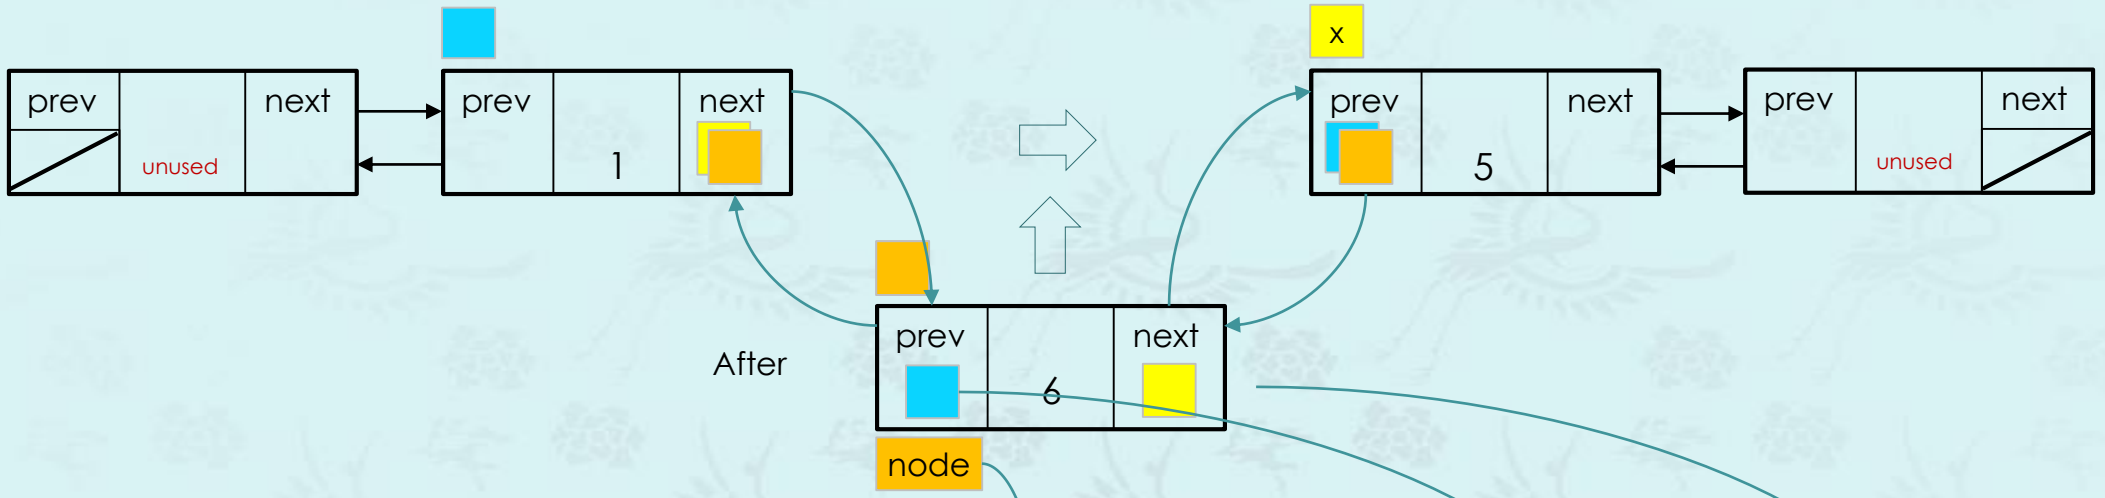
```
                x == x
x->prev->next ==
        x->prev ==
```

Express each color code in terms of x.

```
void insert(pNode x, int value){
                                    node

}
```

Key Operations: Insert a new node(value) **in place of the node x**



Before:

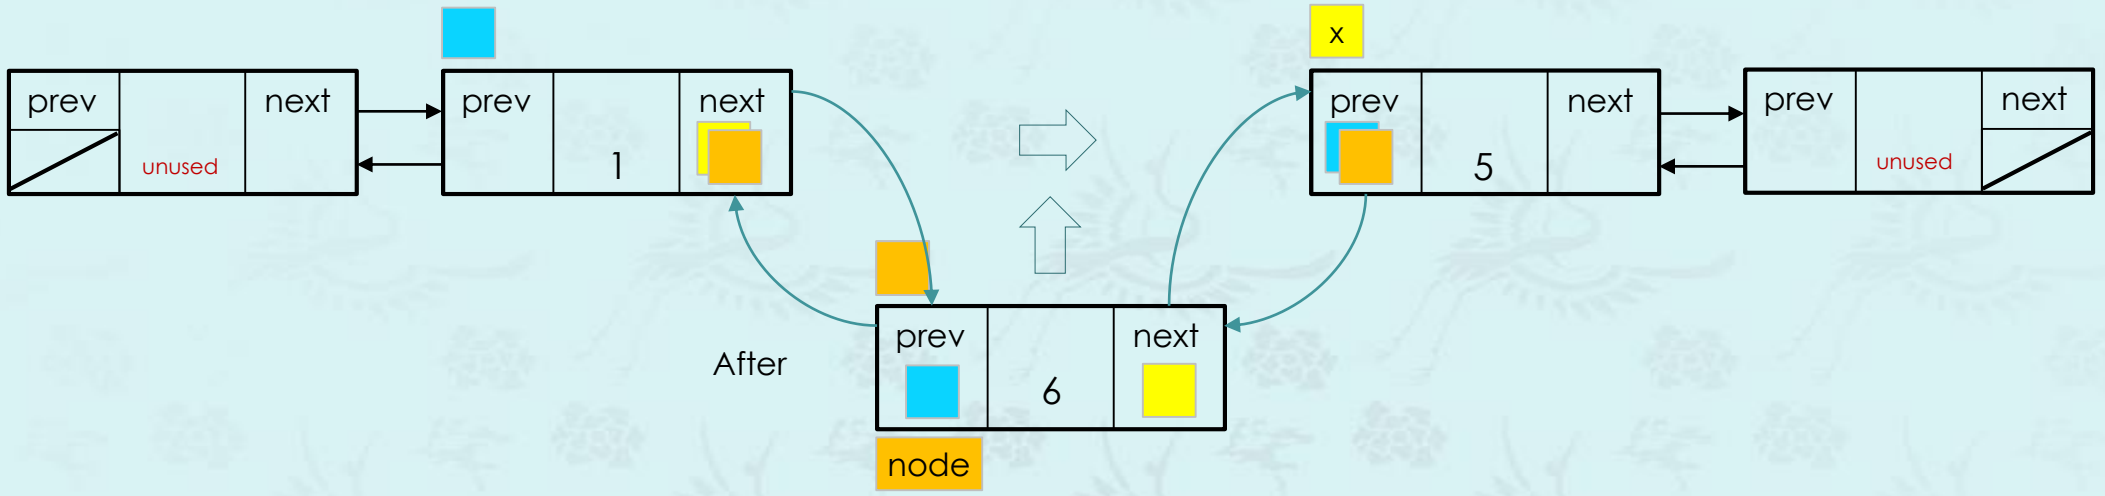
```
                x == x
x->prev->next ==
      x->prev ==
```

Express each color code in terms of x.

```
void insert(pNode x, int value){
  pNode [ ] = new Node{value, [ ][ ]};

}
```

Key Operations: Insert a new node(value) **in place of the node x**



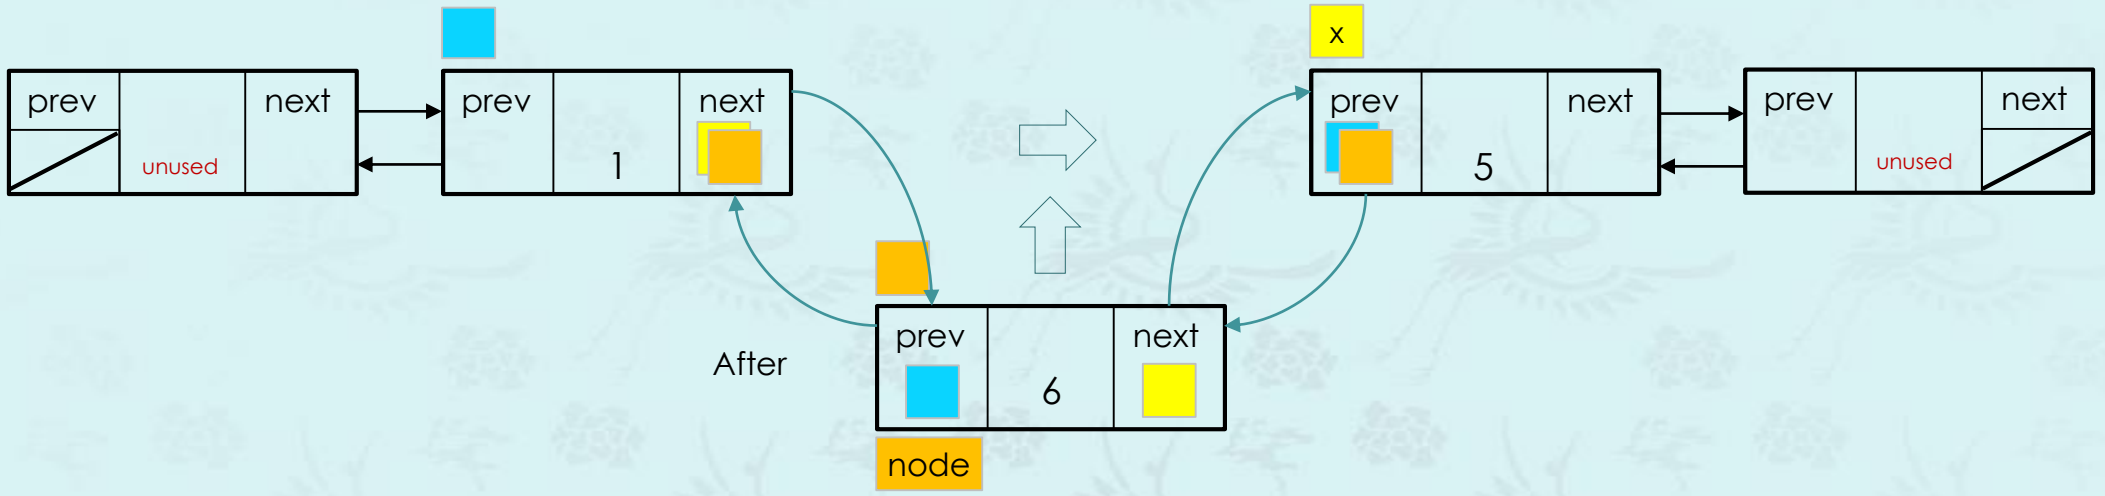
Before:

```
                x == x
x->prev->next ==
      x->prev ==
```

Express each color code in terms of x.

```
void insert(pNode x, int value){
  pNode node = new Node{value, x->prev, x};
  x->prev->next = node;
  x->prev = node;
}
```

Key Operations: Insert a new node(value) **in place of the node x**



Before:

```
              x == x
x->prev->next ==
      x->prev ==
```

Express each color code in terms of x.

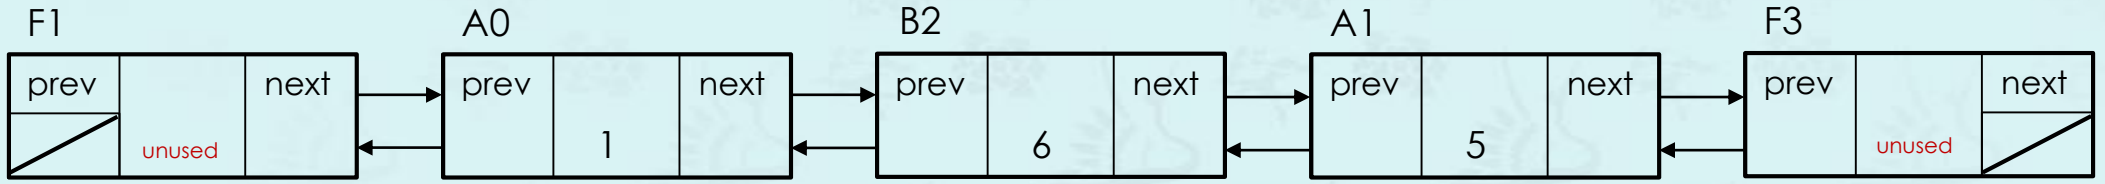
```
void insert(pNode x, int value){
  pNode node = new Node{value, x->prev, x};
  x->prev->next = node;
  x->prev = node;
}
```

Can we replace two lines above with _____

It is a matter of associativity!
Then, what is the associativity of '='?
right to left

```
(1) x->prev = x->prev->next = node;
(2) x->prev->next = x->prev = node;
(3) either one
```

push_front(), push_back(), push()



Case 1: in front

```
void push_front(pList p, int value){
  insert(begin(p)  , value);
}
```

Case 3: at end

```
void push_back(pList p, int value){
  insert(end(p)    , value);
}
```

Case 2: in middle

```
void push(pList p, int value, int z){
  insert(find(p, z), value);
}
```

```
void insert(pNode x, int value){
  pNode node = new Node{value, x->prev, x};
  x->prev = x->prev->next = node;
}
```

```
pNode begin(pList p);                          // returns the first node, not sentinel node
pNode end(pList p);                            // returns the ending sentinel node
pNode half(pList p)                            // returns the node in the middle of the list
pNode find(pList p, int value);                // returns the first node with value
void clear(pList p);                           // free list of nodes
bool empty(pList p);                           // true if empty, false if no empty
int size(pList p);                             // returns size in the list
void insert(pNode x, int value);               // inserts a new node with value at the node x
void erase (pNode x);                          // deletes a node and returns the previous node

void push(pList p, int value, int z);     // inserts a node with value at the node with x
void push_front(pList p, int value);      // inserts a node at front of the list
void push_back(pList p, int value);       // inserts a node with value at end of the list
void push_sorted(pList p, int value, bool ascending = true); // inserts a node in sorted
void pop(pList p, int value);             // deletes the first node with value
void pop_front(pList p);                  // deletes the first node in the list
void pop_back(pList p);                   // deletes the last node in the list, O(1)
void pop_backN(pList p);                  // deletes all the nodes O(n)
void pop_all(pList p, int value);         // deletes all the nodes with value

pList sort(pList p);                      // returns a `new list` sorted
bool sorted(pList p);                     // returns true if the list is sorted
void unique(pList p);                     // returns list with no duplicates, sorted
void reverse(pList p);                    // reverses the sequence
void shuffle(pList p);                    // shuffles the list
void show(pList p);                       // shows all data items in linked list
```

stay tuned for enhancement
