```
struct Node {  
    int    item;           unused in  
    Node*  prev; ← singly linked  
    Node*  next;  
};  
  
struct List {  
    Node*  head;  
    Node*  tail;  
};  
using pNode = Node*;  
using pList = List*;
```

a new node instantiation

(1) `pNode n = new Node;`
`Node* n = new Node;`

(2) `Node* n = new Node();`

(3) `Node* n = new Node{};`

(4) `Node* n = new Node(4);`

(5) `Node* n = new Node{5};`

```
struct Node {
    int    item;
    Node*  prev; ← unused in singly linked
    Node*  next;
};

struct List {
    Node*  head;
    Node*  tail;
};

using pNode = Node*;
using pList = List*;
```

a new node instantiation

- (1) `pNode n = new Node;`
`Node* n = new Node;` ← no values set
- (2) `Node* n = new Node();` ← set to 0 or null
- (3) `Node* n = new Node{};` ← set to 0 or null
- (4) `Node* n = new Node(4);` ← Compiler error
- (5) `Node* n = new Node{5};` ← set to 0 or null

```
struct Node {  
    int    item;  
    Node*  prev; ← unused in singly linked  
    Node*  next;  
};  
  
struct List {  
    Node*  head;  
    Node*  tail;  
};  
using pNode = Node*;  
using pList = List*;

A0

item	next
3	

```
struct Node {  
    int    item;  
    Node*  prev;  
    Node*  next;  
};  
  
struct List {  
    Node*  head;  
    Node*  tail;  
};  
using pNode = Node*;  
using pList = List*;
```

```
struct Node{  
    int item;  
    Node* prev;  
    Node* next;  
    // constructor  
    Node(int d=0, Node* p=nullptr, Node* n=nullptr) {  
        item = d;    prev = p;        next = n;  
    }  
    // destructor  
    ~Node() {}  
};
```

a new node instantiation

```
pNode n = new Node(3);
```

← It is OK, now.

```
Node* n = new Node(3);
```

```
pNode n = new Node{3, nullptr, nullptr};
```

```
Node* n = new Node{3, nullptr, nullptr};
```

```
struct Node {  
    int    item;  
    Node*  prev;  
    Node*  next;  
};  
  
struct List {  
    Node*  head;  
    Node*  tail;  
};  
using pNode = Node*;  
using pList = List*;
```

```
struct Node{  
    int item;  
    Node* prev;  
    Node* next;  
    // constructor  
    Node(int d=0, Node* p=nullptr, Node* n=nullptr) {  
        item = d;    prev = p;    next = n;  
    }  
    // destructor  
    ~Node() {}  
};
```

a new node instantiation

What is the meaning of mnemonic A0?

A0

item	next
3	

```

```

Node structure initialization

```
struct Node {  
    int    item;  
    Node*  prev;  
    Node*  next;  
    Node(const int d = 0, Node* p = nullptr, Node* n = nullptr) {  
        item = d; prev = p; next = n;  
    }  
    ~Node() {}  
};  
using pNode = Node*;
```

Push a node: Three different cases

Given: an item(4) to insert – What was the most difficult part of this coding?

Case 1: in front

Case 2: in middle

Case 3: at end

push a node – Case 1; insert in front, head given

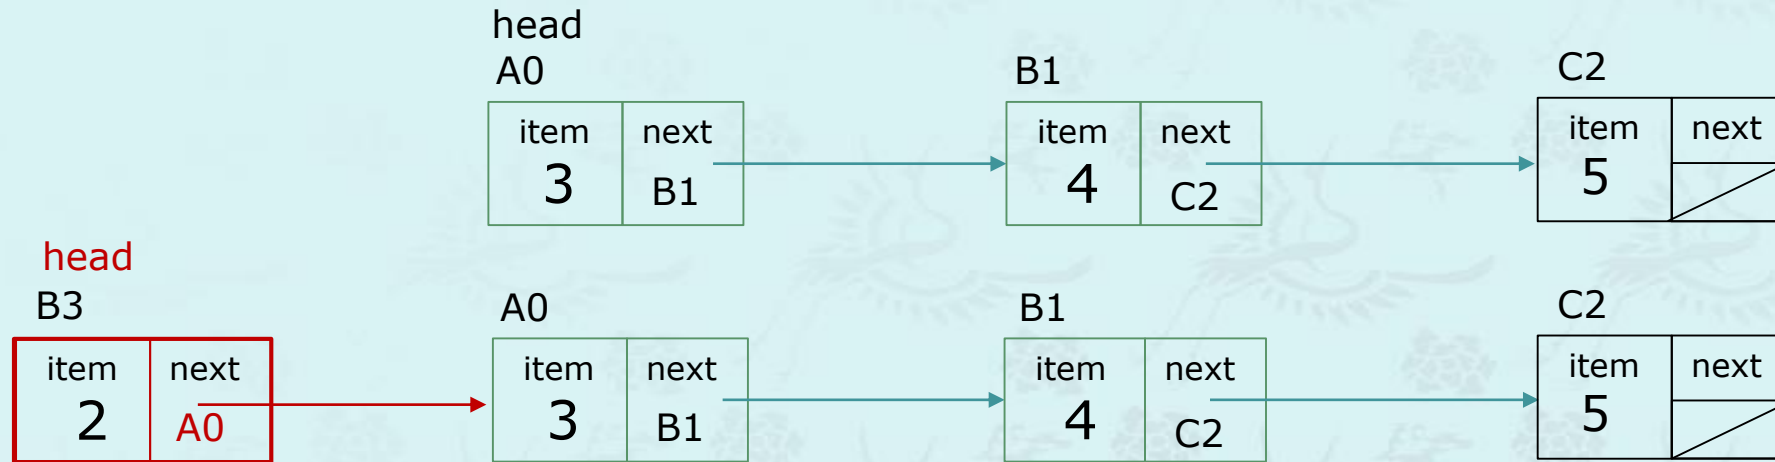

```
pNode node = new Node{2};  
node->next = head;  
head = node;
```

```
pNode node = new Node{2, nullptr, head};  
head = node;
```

```
struct Node{  
    int item;  
    pNode prev;  
    pNode next;  
    // constructor  
    Node(const int d=0, pNode p=nullptr, pNode n=nullptr){  
        item = d;        prev = p; next = n;  
    }  
    // destructor  
    ~Node() {}  
} Node;
```

push a node – Case 1; insert in front, head given

```
pNode node = new Node{2};  
node->next = head;  
head = node;
```

```
pNode node = new Node{2, nullptr, head};  
head = node;
```

```
void push_front(pList p, int val) {  
      
}  
}
```

Complete push_front()

```
struct Node {  
    int    item;  
    Node*  prev;  
    Node*  next;  
};  
  
struct List {  
    Node*  head;  
    Node*  tail;  
};  
  
using pNode = Node*;  
using pList = List*;
```

push a node – Case 3; insert at end, head given

- find the last node.
- append a new Node{7}.

```
pNode last(pNode list)
```

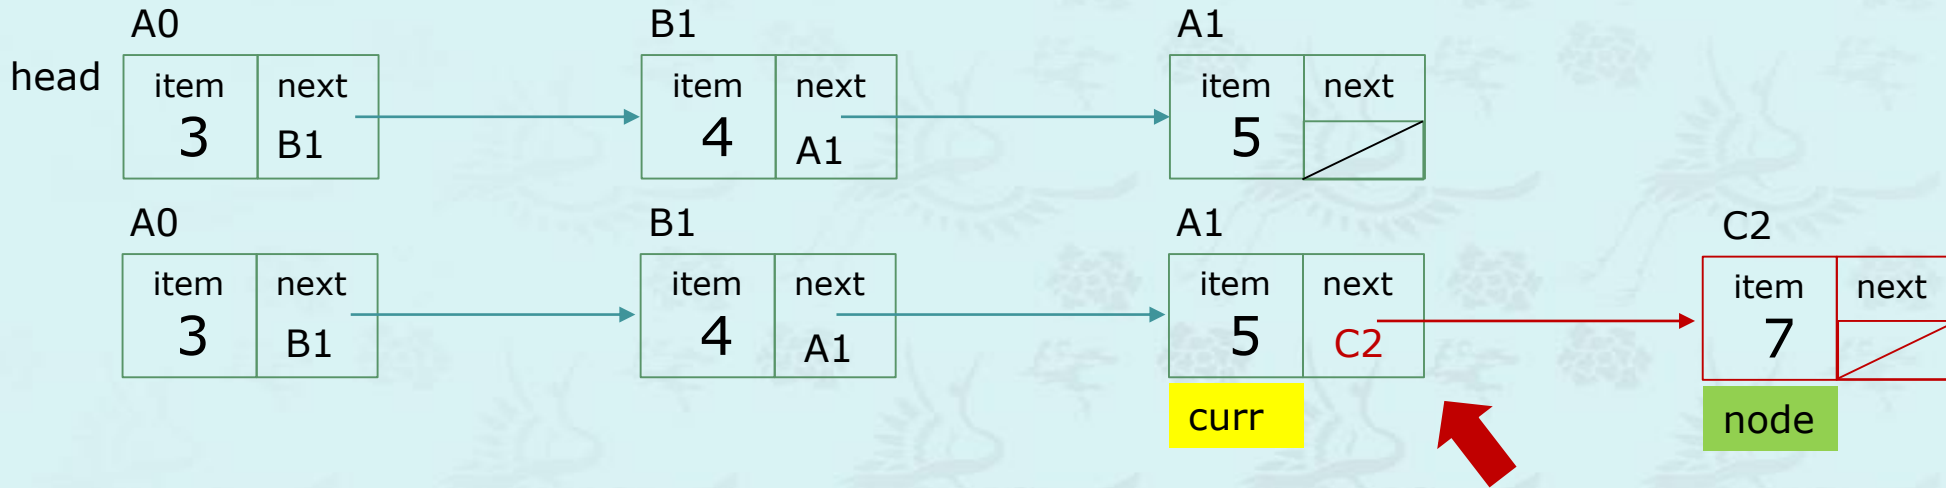

```
pNode x = list; ← need this?
```

```
while
```

```
    x = x->next;
```

```
return x;
```

push a node – Case 3; insert at end, head given

```
curr = last(list->head);  
pNode node = new Node{7};  
curr->next = node;
```

```
curr = last(list->head);  
curr->next = new Node{7};
```

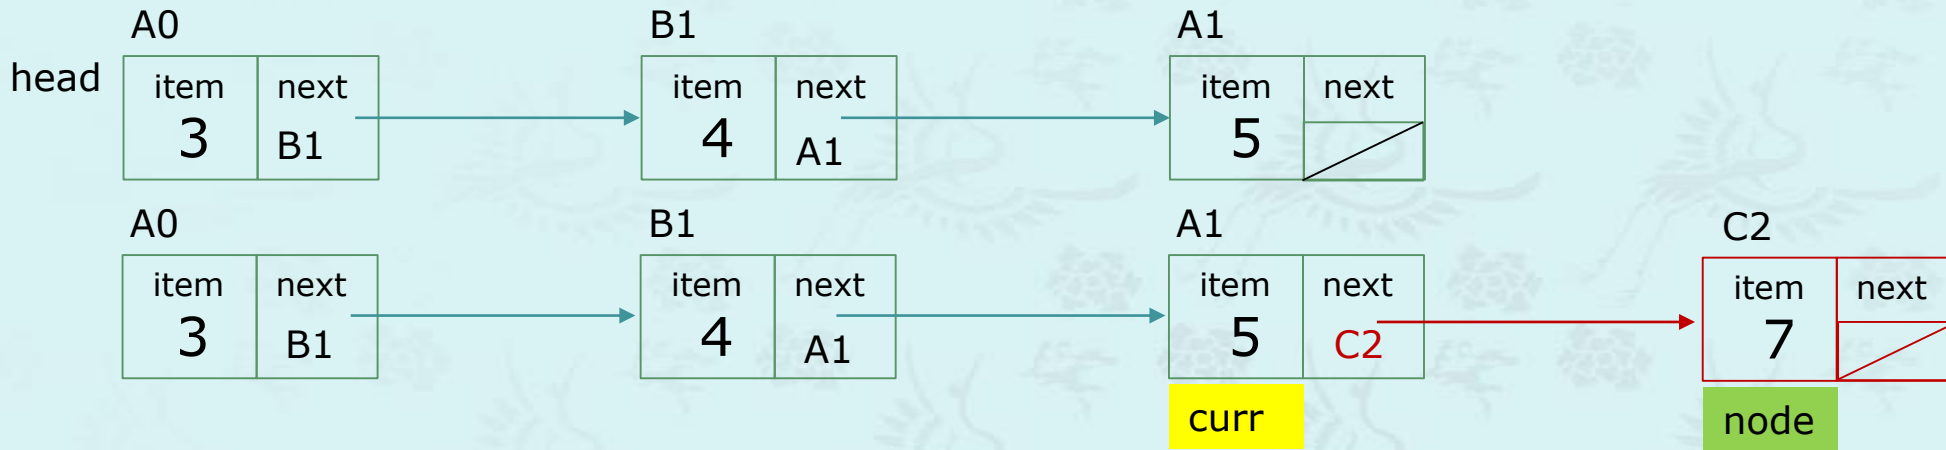

```
void push_back(pList p, int val) {  
    curr = last(p->head);  
    curr->next = new Node{val};  
}
```

- find the last node.
- append a new Node{7}.

```
pNode last(pNode list)
```

```
pNode x = list;  
while (x->next != nullptr)  
    x = x->next;  
return x;
```

push a node – Case 3; insert at end, head given

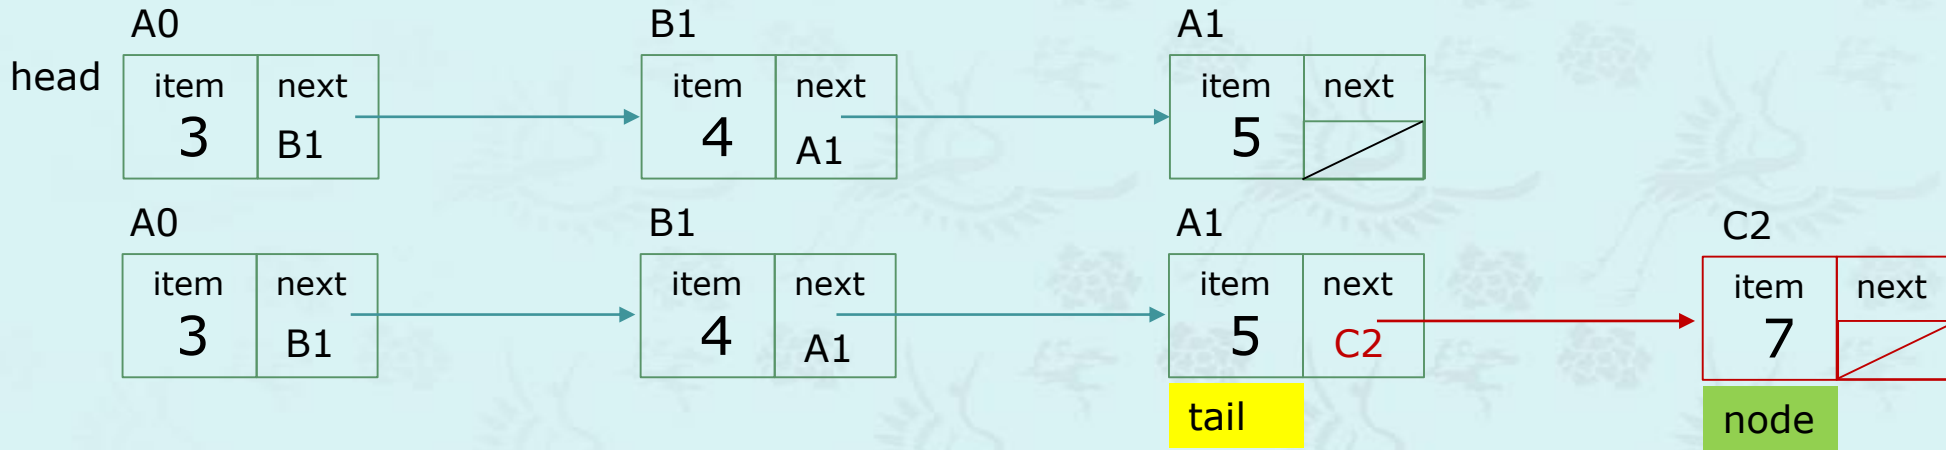

```
curr = last(list->head);  
pNode node = new Node{7};  
curr->next = node;
```

```
curr = last(list->head);  
curr->next = new Node{7};
```

```
void push_back(pList p, int val) {  
    curr = last(p->head);  
    curr->next = new Node{val};  
}
```

← O(n)

push a node – Case 3; insert at end, head given

```
curr = last(list->head);
pNode node = new Node{7};
curr->next = node;
```

```
curr = last(list->head);
curr->next = new Node{7};
```

```
void push_back(pList p, int val) {
    curr = last(p->head);
    curr->next = new Node{val};
}
```

$O(1)$

$O(n)$

```
void push_back(pList p, int val) {
    pNode node = new Node{val};
    p->tail->next = node;
    p->tail = node;
}
```

push a node – Case 2; insert in middle, prev given

push a node – Case 2; insert in middle, prev given

```
pNode node = new Node{4};  
prev->next = node;      B1  
node->next = prev->next; A1
```

- We have a bug. Debug it!

push a node – Case 2; insert in middle, prev given

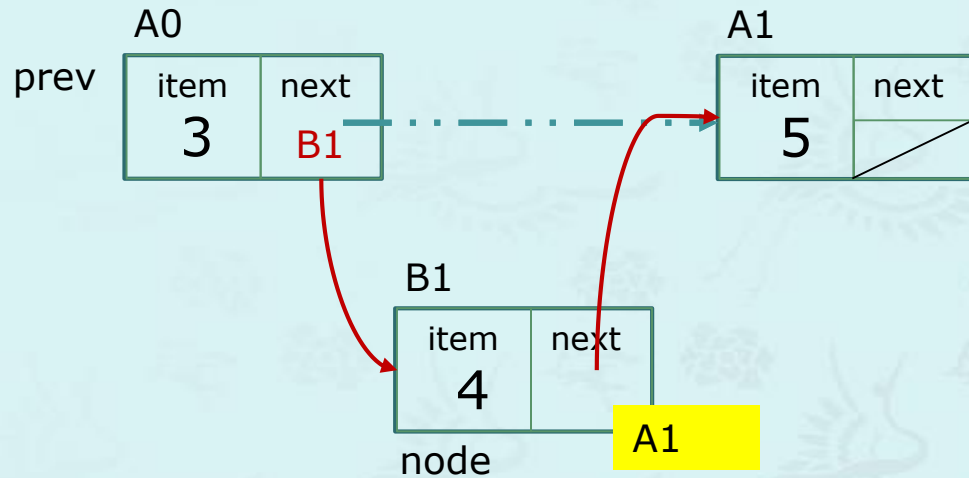

```
pNode node = new Node{4};  
prev->next = node; ❌  
node->next = prev->next;
```

B1
A1

```
pNode node = new Node{4};  
node->next = prev->next;  
prev->next = node;
```

A1
B1

push a node – Case 2; insert in middle, prev given

```
pNode node = new Node{4};  
prev->next = node; ❌  
node->next = prev->next;
```

B1

A1

```
pNode node = new Node{4};  
node->next = prev->next;  
prev->next = node;
```

A1

B1

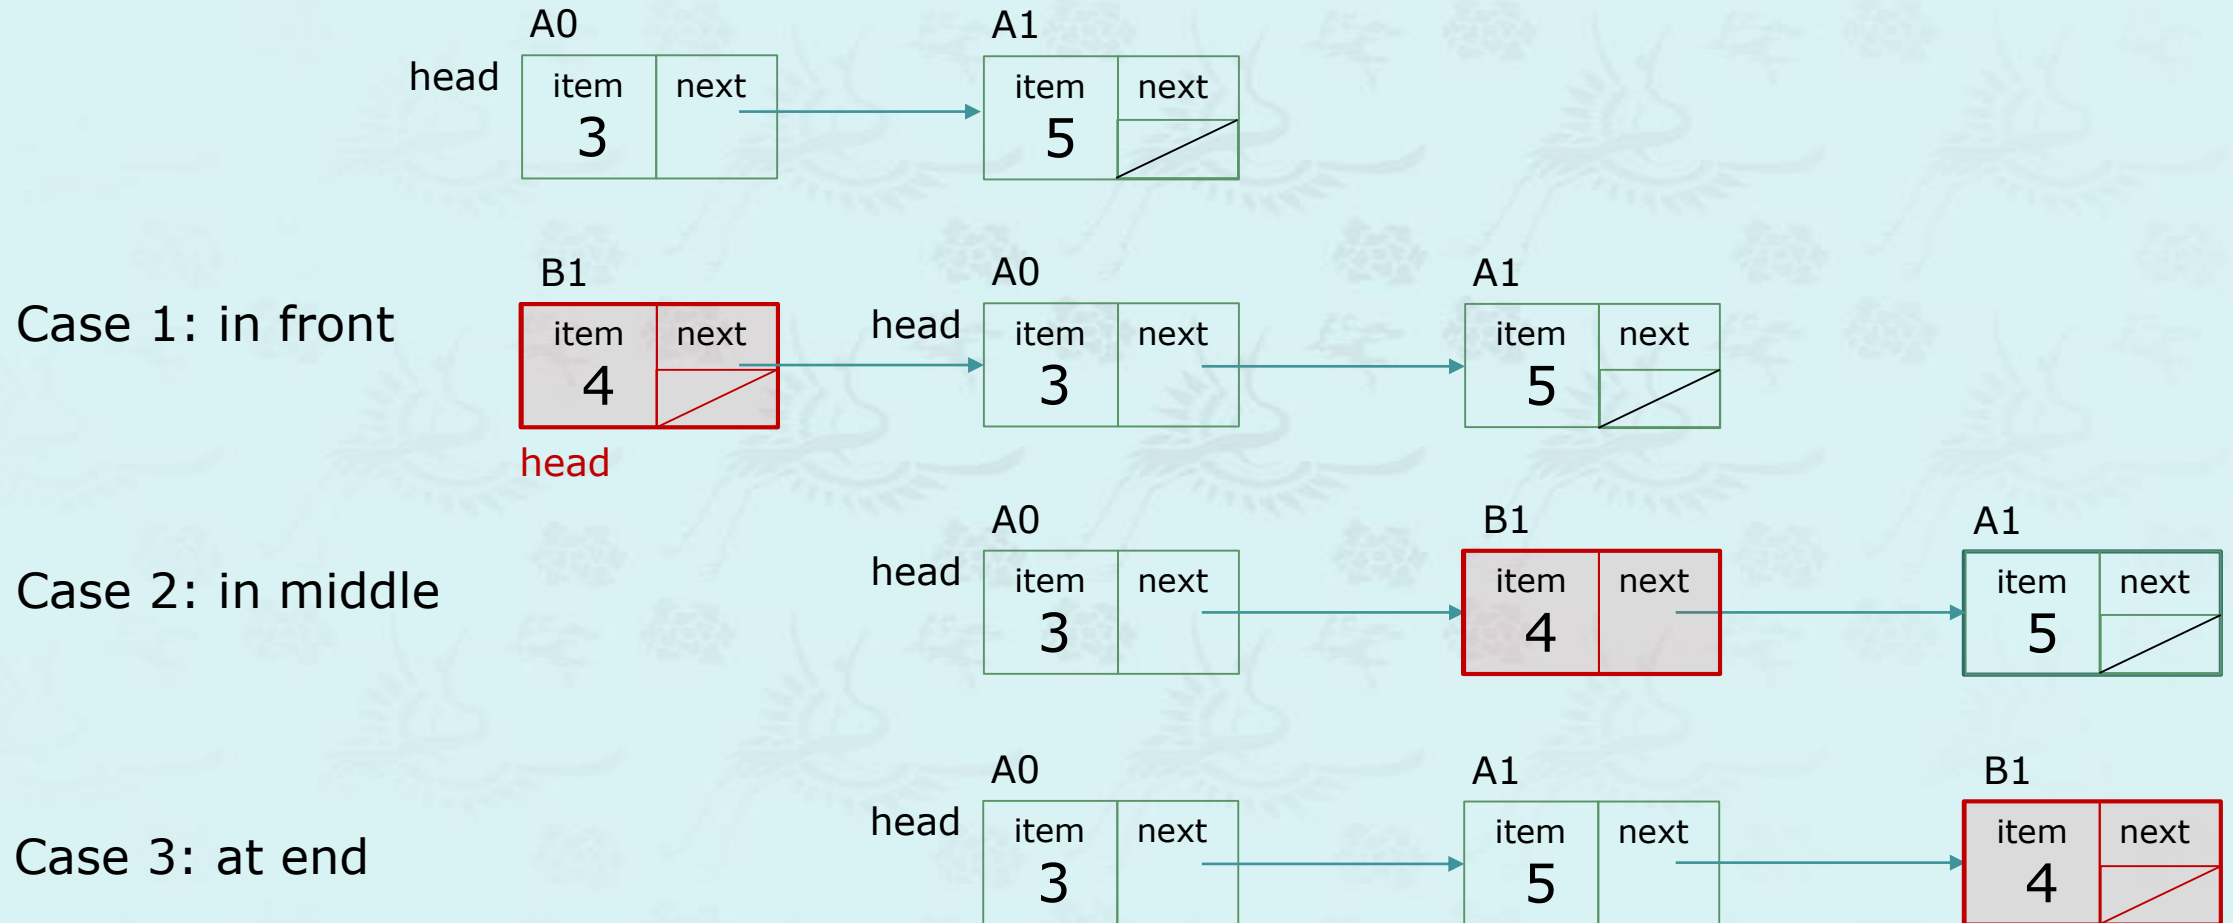

```
prev->next = new Node(4, nullptr, prev->next);
```

```
// inserts a node val at node x  
void push_at(pList p, int val, int x) {  
    if (empty(p)) return push_front(p, val);  
    // if the first node is x;  
    if (p->head->item == x)  
        return push_front(p, val);  
}
```

```
pNode curr = p->head;  
pNode prev = nullptr;  
while (curr != nullptr) {  
    if (curr->item == x) {  
        prev->next = new Node{val, prev->next};  
        return;  
    }  
    prev = curr;  
    curr = curr->next;  
}
```

Push a node: Three different cases

Given: an item(4) to insert – **What was the most difficult part of this coding?**

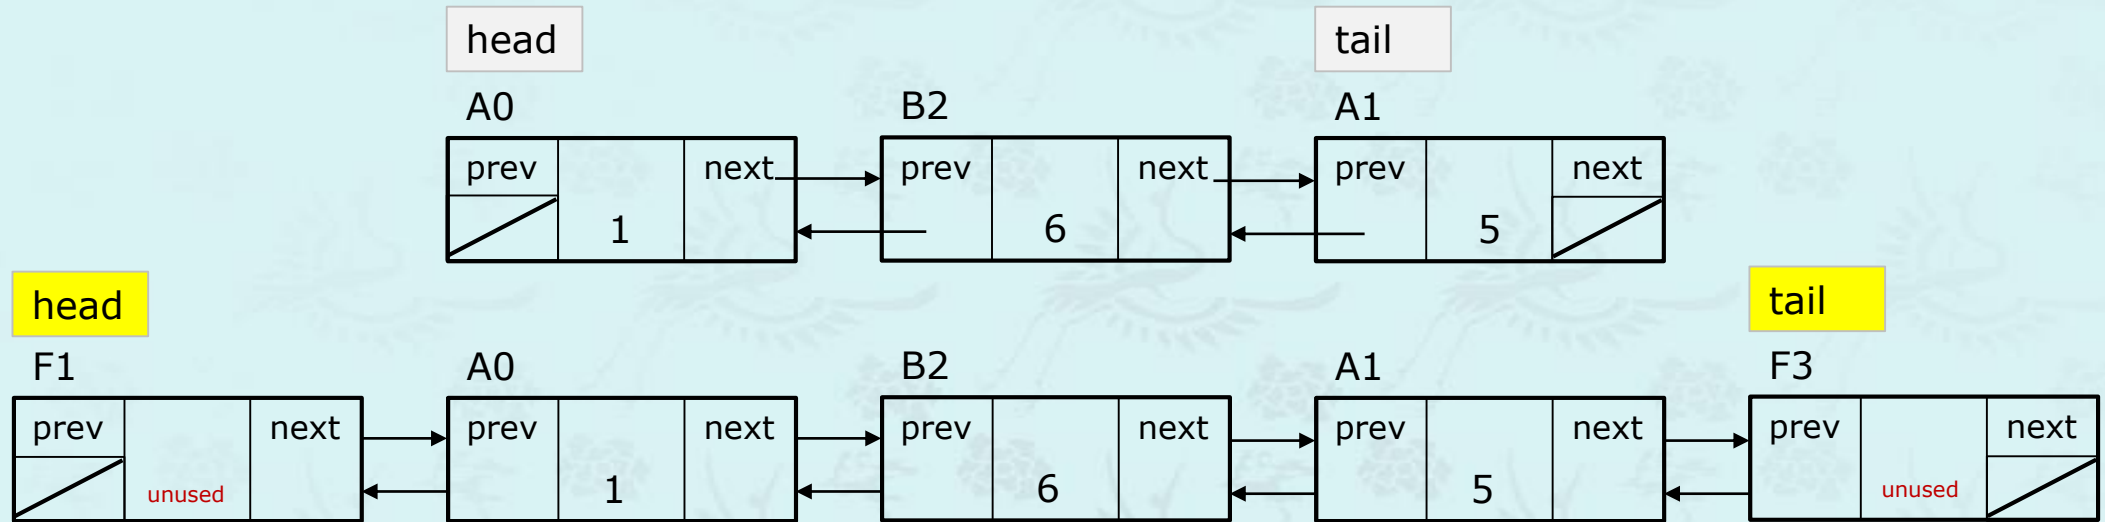

Push a node: Three different cases

Given: an item(4) to insert – **What was the most difficult part of this coding?**

doubly linked list with sentinel nodes

- **Solution**

- **doubly linked list with sentinel nodes**
- Each node carries the pointer to the previous node.
- There is only one case (middle) with two sentinel nodes.

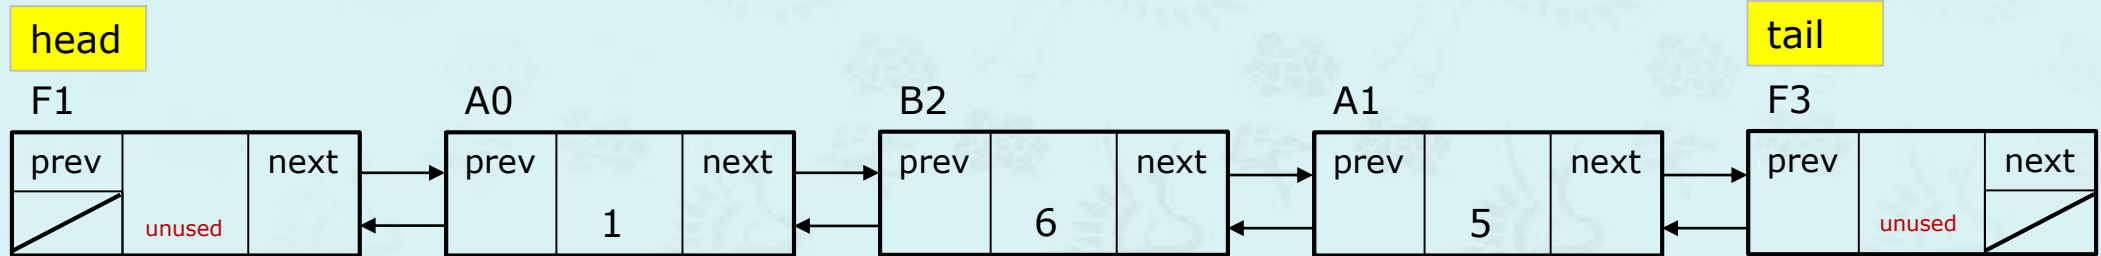

doubly linked list with sentinel nodes

```
struct Node {  
    int    item;  
    Node*  prev;  
    Node*  next;  
    Node(const int d = 0, Node* p = nullptr, Node* n = nullptr) {  
        item = d; prev = p; next = n;  
    }  
    ~Node() {}  
};
```

```
struct List {  
    Node* head;  
    Node* tail;  
    List() { head = new Node;      tail = new Node;  
            head->next = tail;    tail->prev = head;  
            head->prev = nullptr; tail->next = nullptr;  
    }  
    ~List() {}  
};
```

```
using pNode = Node*;  
using pList = List*;
```

doubly linked list with sentinel nodes - **Exercise**

```
pNode begin(pList p) {  
    return p->head->next;  
}
```

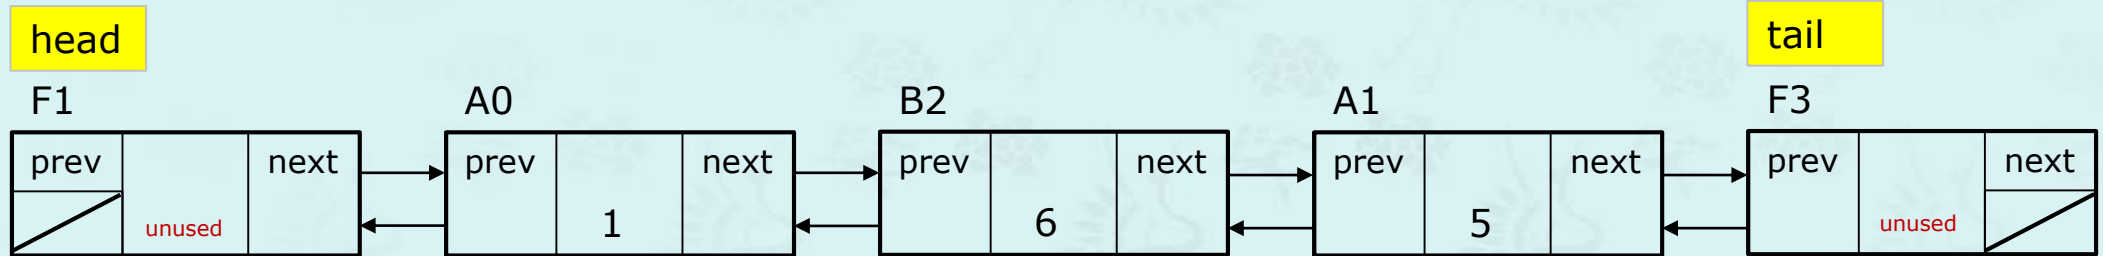

```
pNode empty(pList p) {  
    return begin(p) == end(p);  
}
```

```
pNode end(pList p) {  
    return p->tail;  
}
```

```
pNode last(pList p) {  
    return end(p)->prev;  
}
```

doubly linked list with sentinel nodes - **Exercise**

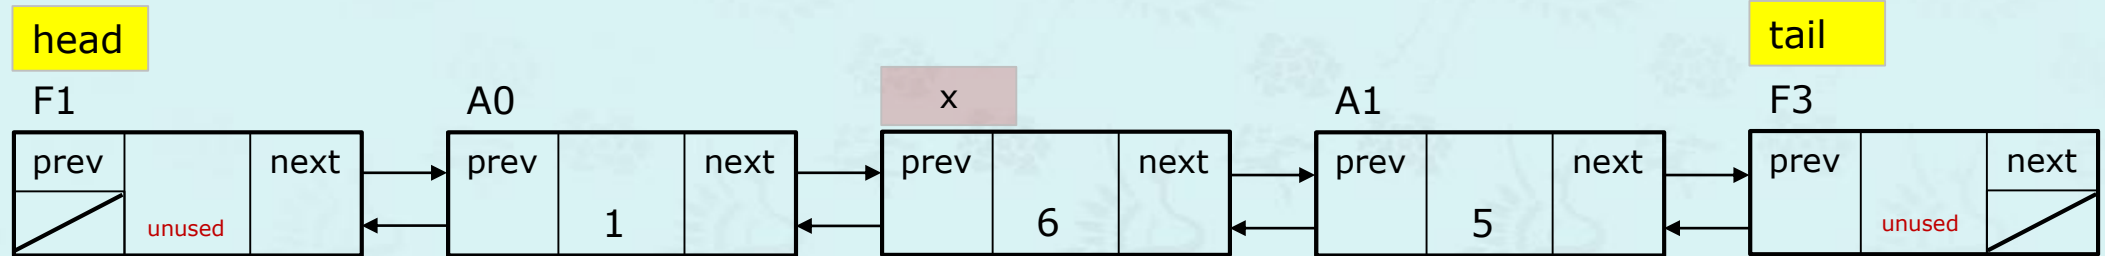

```
pNode begin(pList p) {  
    return p->head->next;  
}
```

```
pNode end(pList p) {  
    return p->tail;  
}
```

```
int count(pList p) {  
    int count = 0;  
    pNode c = begin(p);  
    while(c != end(p)) {  
        count++;  
        c = c->next;  
    }  
    return count;  
}
```

doubly linked list with sentinel nodes

```
pNode begin(pList p) {  
    return p->head->next;  
}
```

```
pNode end(pList p) {  
    return p->tail;  
}
```

```
pNode (pList p, int val){  
    pNode curr = begin(p);  
    while(curr != end(p)) {  
        if (curr->item == val)  
            return curr;  
        curr = curr->next;  
    }  
    return curr;  
}
```

doubly linked list with sentinel nodes

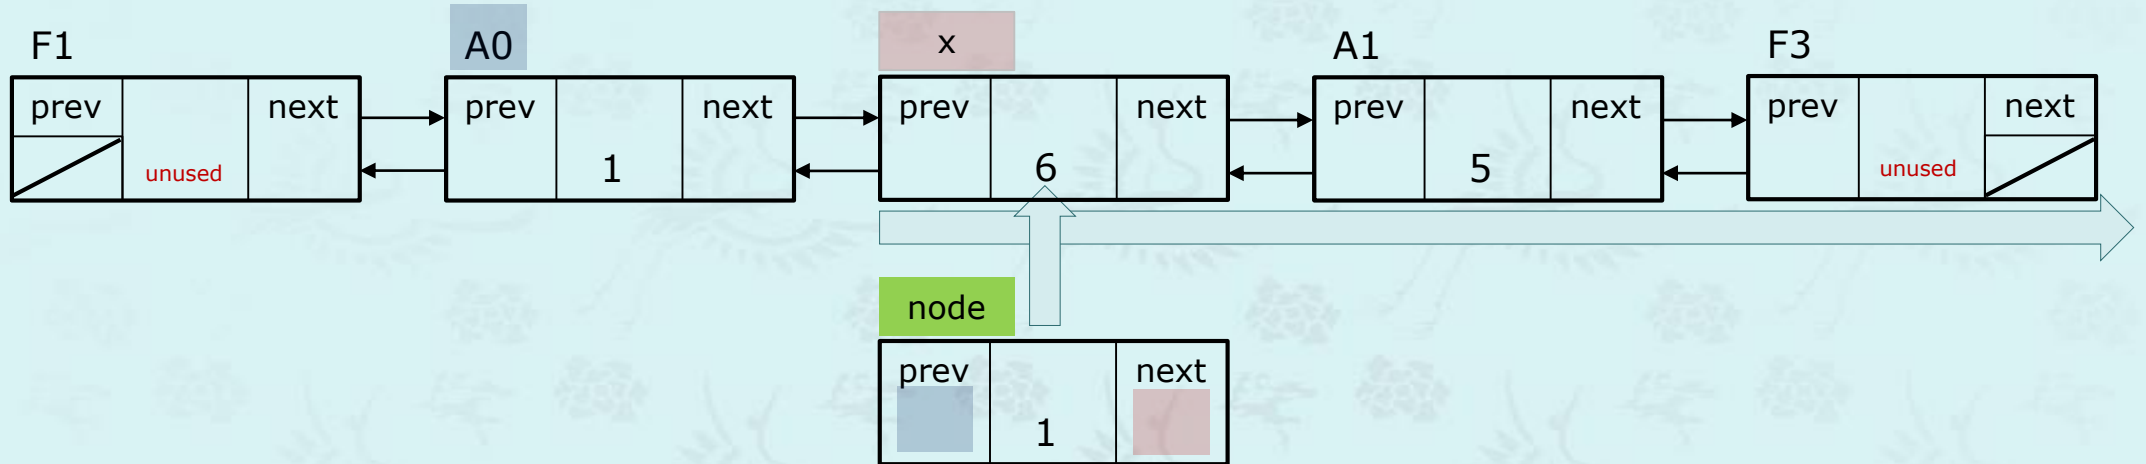

```
pNode begin(pList p) {  
    return p->head->next;  
}
```

```
pNode end(pList p) {  
    return p->tail;  
}
```

```
pNode find(pList p, int val){  
    pNode curr = begin(p);  
    while(curr != end(p)) {  
        if (curr->item == val)  
            return curr;  
        curr = curr->next;  
    }  
    return curr;  
}
```

```
pNode find(pList p, int val){  
    pNode x = begin(p);  
    for (; x != end(p); x = x->next;)  
        if (x->item == val) return x;  
    return x;  
}
```

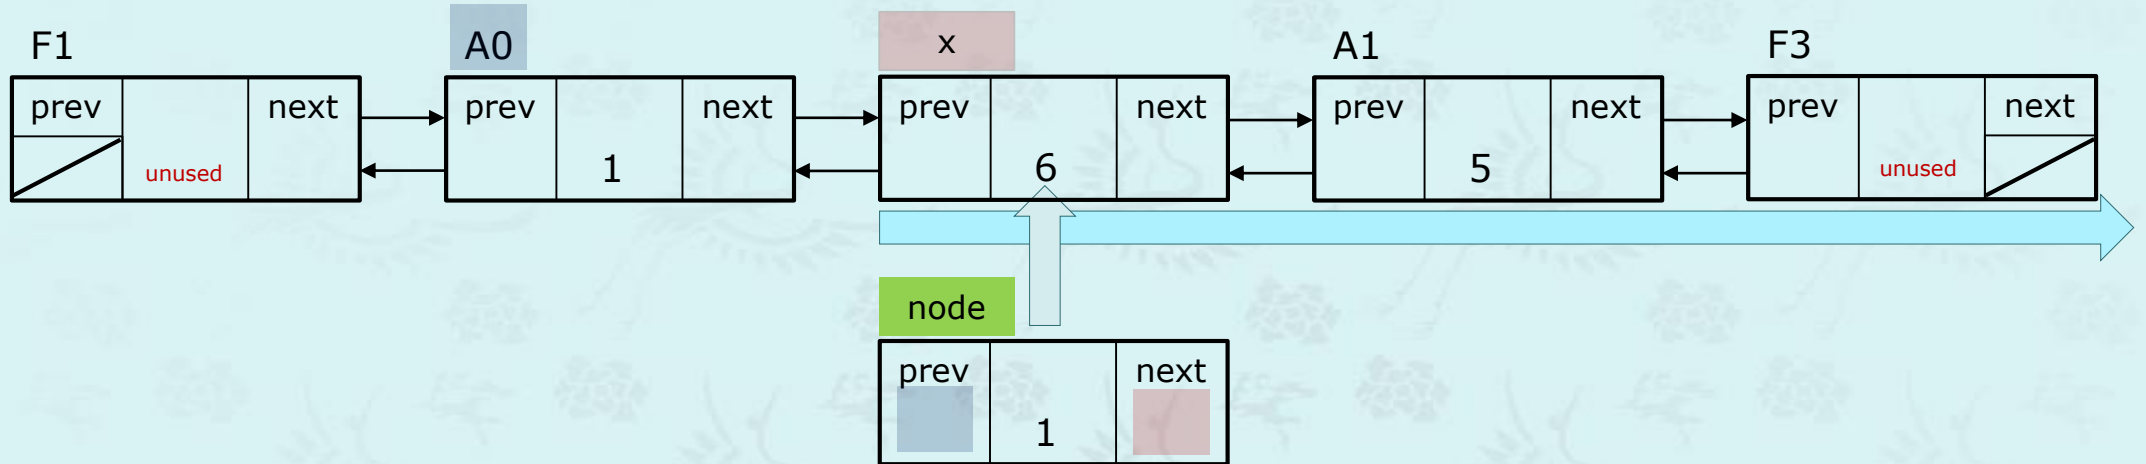

doubly linked list with sentinel nodes

```
void insert(pNode x, int val){  
  
}
```

```
struct Node{  
    int item;  
    Node* prev;  
    Node* next;  
    // constructor  
    Node(int d=0, Node* p=nullptr, Node* n=nullptr) {  
        item = d;          prev = p;  next = n;  
    }  
    // destructor  
    ~Node() {}  
};
```

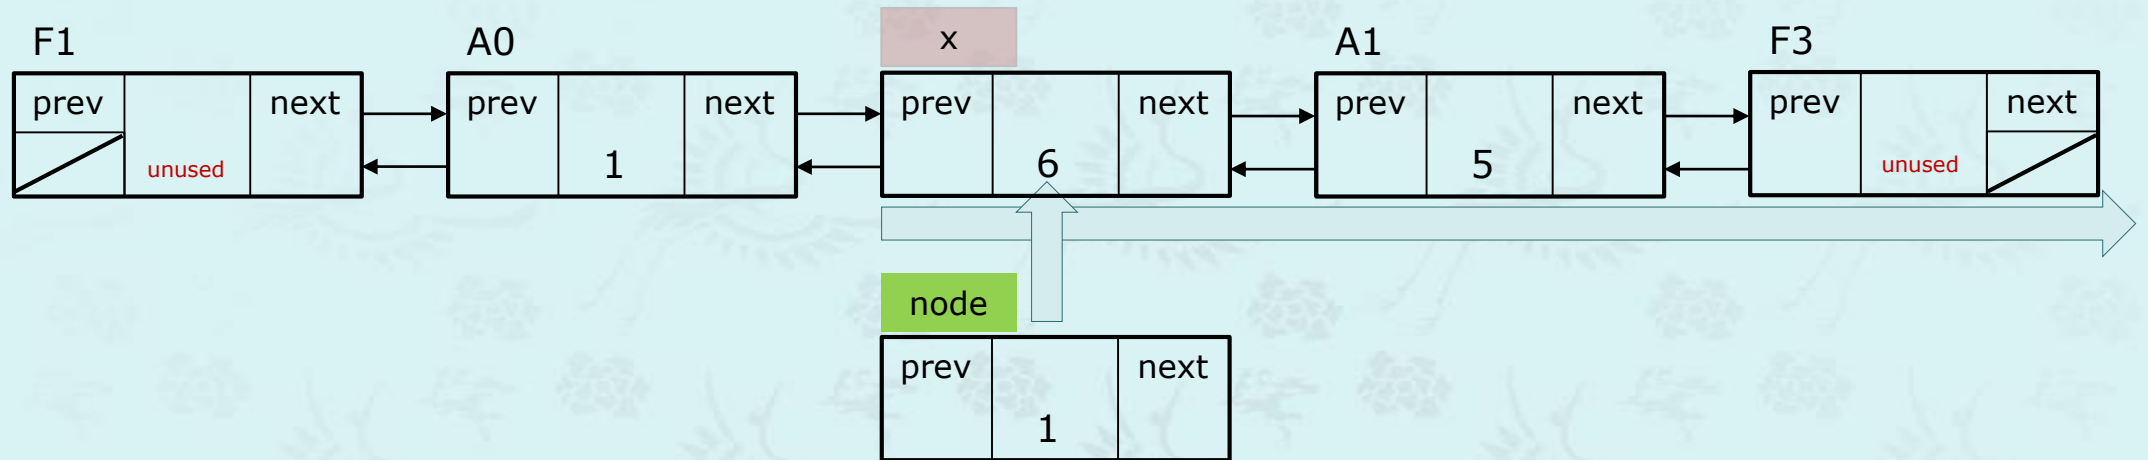

doubly linked list with sentinel nodes

```
void insert(pNode x, int val){  
    pNode node = new Node{ val, x->prev, x };  
}
```

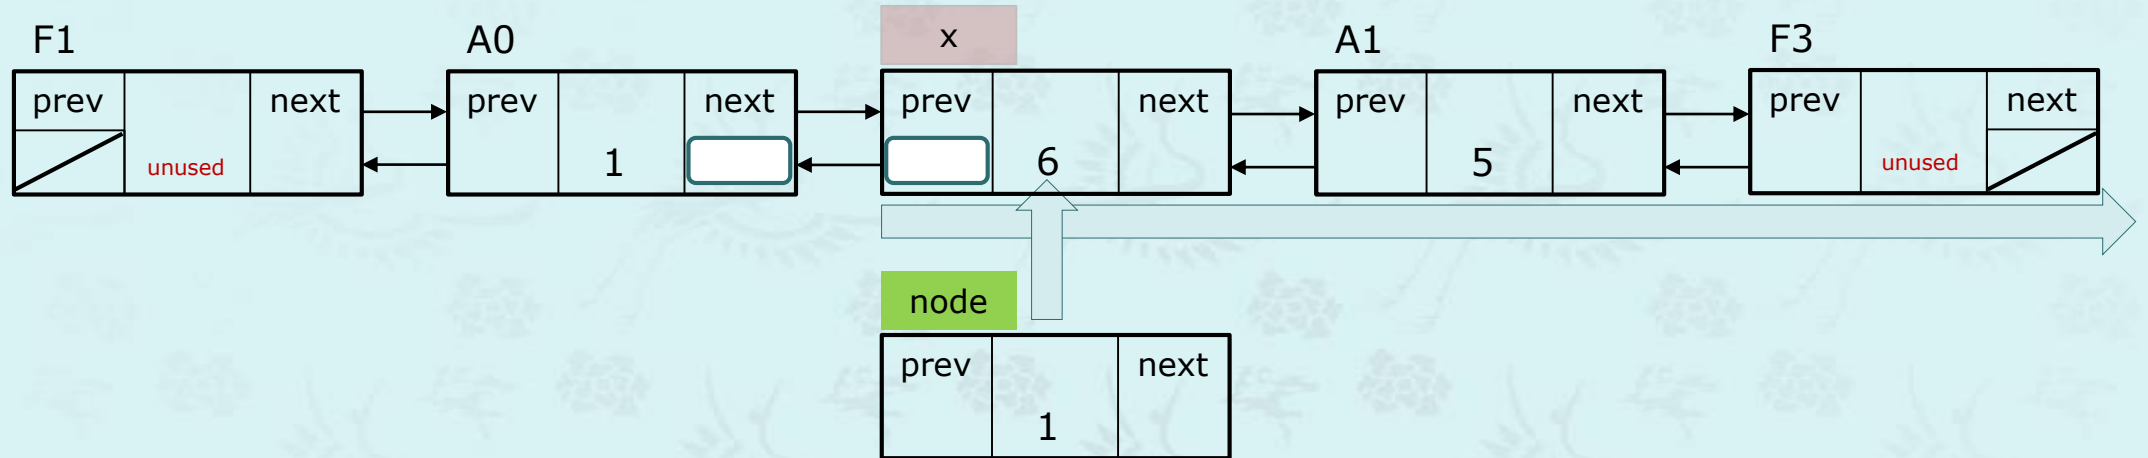

```
struct Node{  
    int item;  
    Node* prev;  
    Node* next;  
    // constructor  
    Node(int d=0, Node* p=nullptr, Node* n=nullptr) {  
        item = d;          prev = p;  next = n;  
    }  
    // destructor  
    ~Node() {}  
};
```

doubly linked list with sentinel nodes

```
void insert(pNode x, int val){  
    pNode node = new Node{ val, x->prev, x };  
    _____ = node;  
}
```

doubly linked list with sentinel nodes

```
void insert(pNode x, int val){  
    pNode node = new Node{ val, x->prev, x };  
    x->prev->next = x->prev = node;  
}
```

doubly linked list with sentinel nodes

Case 1: in front

```
void push_front(pList p, int val){  
    insert(begin(p), val);  
}
```

Case 3: at end

```
void push_back(pList p, int val){  
    insert(end(p), val);  
}
```

Case 2: in middle

```
void push(pList p, int val, int x){  
    insert(find(p, x), val);  
}
```

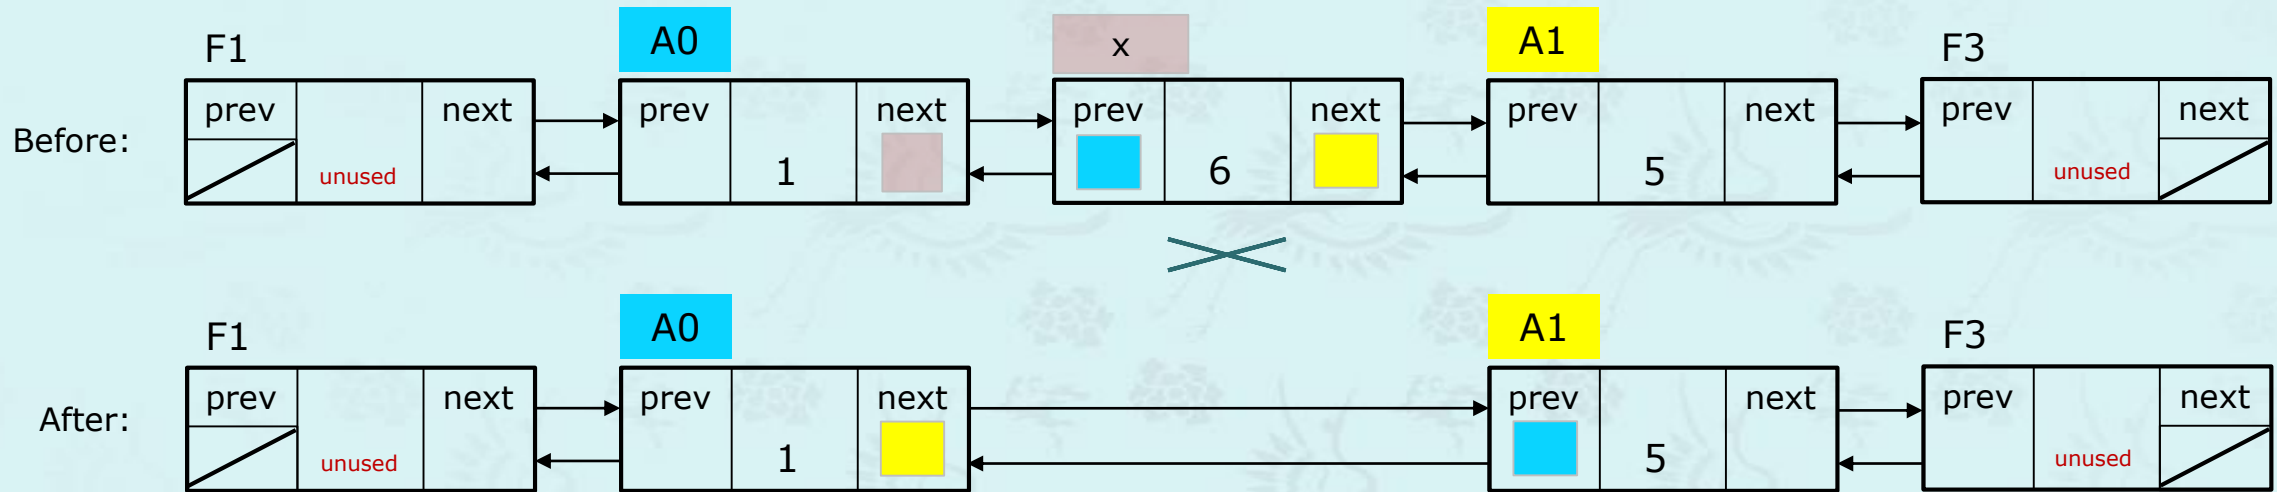

```
void insert(pNode x, int val){  
    pNode node = new Node{ val, x->prev, x };  
    x->prev = x->prev->next = node;  
}
```

doubly linked list with sentinel nodes

```
void erase(pNode x){  
    x->prev->next = x->next;  
    x->next->prev = x->prev;  
    delete x;  
}
```

doubly linked list with sentinel nodes

```
void erase(pNode x){  
    x->prev->next = x->next;  
    x->next->prev = x->prev;  
    delete x;  
}
```

```
pNode find(pList p, int val)
```

Implement pop() using erase() and find().

```
void pop(pList p, int val){  
  
}
```

doubly linked list with sentinel nodes

```
void erase(pNode x){  
    x->prev->next = x->next;  
    x->next->prev = x->prev;  
    delete x;  
}
```

```
pNode find(pList p, int val)
```

Implement pop() using erase() and find().

```
void pop(pList p, int val){  
    erase(find(p, val));  
}
```

doubly linked list with sentinel nodes

```
struct Node {
    int    item;
    Node*  prev;
    Node*  next;
    Node(const int d = 0, Node* p = nullptr, Node* n = nullptr) {
        item = d; prev = p; next = n;
    }
    ~Node() {}
};

struct List {
    Node* head;
    Node* tail;
    List() { head = new Node;      tail = new Node;
