

# Data Structures

## Chapter 7: Graph

1. Introduction
  - **Terminology, Representation, ADT**
2. Basic Operations
  - DFS, CC, BFS, Processing
3. Digraph and Applications
4. Minimum Spanning Tree(MST)

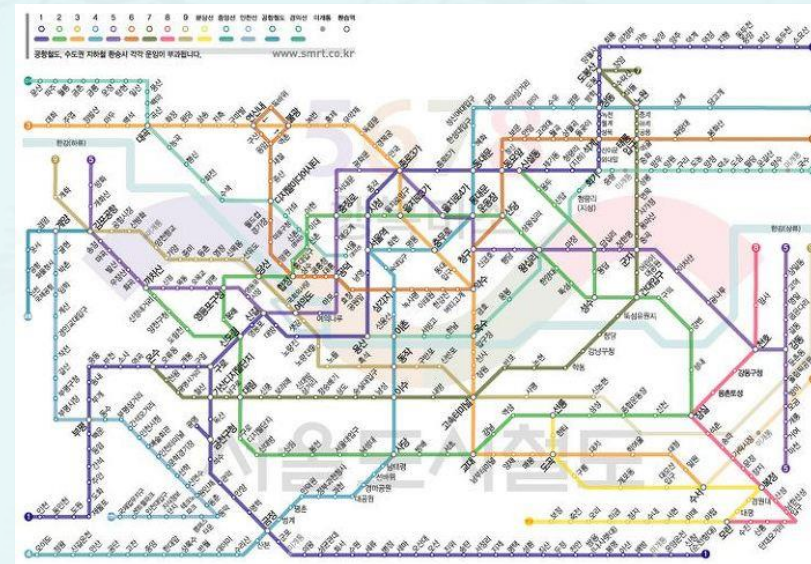

A pair of black-rimmed glasses is placed on an open book. The book's pages are filled with text, though it is out of focus. The scene is lit with a warm, golden light, creating a soft and contemplative atmosphere.

너는 청년의 때에 너의 창조주를 기억하라. 곧 곤고한 날이 이르기 전에, 나는 아무 낙이 없다고 할  
해들이 가깝기 전에 (전도서 12:1)

모든 사람이 죄를 범하였으매 하나님의 영광에 이르지 못하더니 그리스도 예수 안에 있는 속량으로  
말미암아 하나님의 은혜로 값없이 의롭다 하심을 얻은 자 되었느니라 (로마서 3:23-24)

# Undirected graphs

- **Graph: Set of vertices connected pairwise by edges**
- *Why study graph algorithms?*
  - Thousands of practical applications.
  - Hundreds of graph algorithms known.
  - Interesting and broadly useful abstraction.
  - Challenging branch of computer science and discrete math.

# Undirected graphs

- Chemical Environments: Protein Graphs

# Undirected graphs

- The Spread of Obesity in a Large Social Network over 32 Years

**Figure 1.** Largest Connected Subcomponent of the Social Network in the Framingham Heart Study in the Year 2000. Each circle (node) represents one person in the data set. There are 2200 persons in this subcomponent of the social network. Circles with red borders denote women, and circles with blue borders denote men. The size of each circle is proportional to the person's body-mass index. The interior color of the circles indicates the person's obesity status: yellow denotes an obese person (body-mass index,  $\geq 30$ ) and green denotes a nonobese person. The colors of the ties between the nodes indicate the relationship between them: purple denotes a friendship or marital tie and orange denotes a familial tie.

# Undirected graphs

- **the Opte Project:** Visualization of the various routes through a portion of the Internet

# Undirected graphs

- "Visualizing Friendships" by Paul Butler – an intern at Facebook

# Graph Applications

graph	vertex	edge
communication	telephone, computer	fiber optic cable
circuit	gate, register, processor	wire
mechanical	joint	rod, beam, spring
financial	stock, currency	transactions
transportation	street intersection, airport	highway, airway route
internet	class C network	connection
social relationship	person, actor	friendship, movie cast
neural network	neuron	synapse
protein network	protein	protein-protein interaction
molecule	atom	bond

# Graph Terminology

- **Path:** Sequence of vertices connected by edges.
- **Cycle:** Path whose first and last vertices are the same.
- Two vertices are **connected** if there is a path between them.

# Graph Terminology

---

- **Path:** Sequence of vertices connected by edges.
- **Cycle:** Path whose first and last vertices are the same.
  
- **Cycle** Is there a cycle in the graph?
- **Euler tour** Is there a cycle that uses each **edge** exactly once?
- **Hamilton tour** Is there a cycle that uses each **vertex** exactly once.
  
- **Connectivity** Is there a way to connect all of the vertices?
- **MST** What is the best way to connect all of the vertices?
- **BiConnectivity** Is there a vertex whose removal disconnects the graph?
  
- **Planarity** Can you draw the graph in the plane with no crossing edges
- **Graph isomorphism** Do two adjacency lists represent the same graph?
  
- **Challenge** Which of these problems are easy? difficult? intractable?

# Graph Representation

- **Graph drawing.** Provides intuition about the structure of the graph.

two drawings of the same graph

# Graph Representation

## Vertex representation.

- We use integers between **0** and  **$V - 1$** .
- Applications: convert between names and integers with symbol table.

## Anomalies

# Graph ADT

.

return type	Graph	
	Graph(int V)	<i>create an empty graph with V vertices</i>
	Graph(char *fname)	<i>create a graph from input stream</i>
void	addEdge(int v, int w)	<i>add an edge v-w</i>
vector<Int>	adjacent(int V)	<i>vertices adjacent to v</i>
int	V()	<i>number of vertices</i>
int	E()	<i>number of edges</i>
	toString()	<i>string representation</i>

## Compute the **degree** of V

```
int degree(graph g, int v) {
    if (!validVertex(g, v)) return -1;
    int deg = 0;
    for (gnode w = g->adj[v].next; w; w = w->next, deg++);
    return deg;
}
```

## Compute maximum degree

```
int degree(graph g) {
    int max = 0;
    for (int v = 0; v < V(g); ++v) {
        int deg = degree(g, v);
        if (deg > max) max = deg;
    }
    return max;
}
```

## Compute average degree

```
double degree_average(graph g) {
    int return 2.0 * E(g) / V(g);
}
```

1. Edge list
2. Adjacency matrix
3. Adjacency list

# Graph Coding – edge list

## 1. Maintain a list of the edges (linked list or array)

# Graph Coding – Adjacency-matrix 인접행렬

2. Maintain a two-dimensional V-by-V Boolean array;  
for each edge v-w in graph:  $\text{adj}[v][w] = \text{adj}[w][v] = \text{true}$ .

# Graph Coding – Adjacency list 인접리스트

## 3. Maintain vertex-index array of lists.

use Bag in Java.  
use a linked list in C/C++.

# Graph Coding – graph.h

```
// a structure to represent an adjacency list of vertices
struct Gnode {
    int    item;
    Gnode* next;
    Gnode (int i, Gnode *p = nullptr) {
        item = i;  next = p;
    }
    ~Gnode() {}
};

using gnode = Gnode *;
```

adjacent vertices using a singly **linked list**

next vertex to link if any.

# Graph Coding – graph.cpp

```
struct Graph {  
    int V;           // N vertices  
    int E;           // N edges  
    gnode adj;       // array of linked lists of vertices  
    Graph(int v = 0) { // constructs a graph with v vertices  
        V = v;  
        E = 0;  
        adj = new (nothrow) Gnode[v];  
        assert(adj != nullptr);  
  
        for (int i = 0; i < v; i++) { // initialize adj list as empty;  
            adj[i].next = nullptr; ← set each adj list nullptr  
            adj[i].item = i;         ← to begin with  
        }                          ← unused;  
    }                               but may store the degree of vertex i.  
    ~Graph() {}  
};  
using graph = Graph *;
```

```
graph g = new Graph(v);  
for (int i = 0; i < E; i++)  
    addEdge(g, from[i], to[i]);
```

# Graph Coding – Adjacency-matrix 인접행렬

**In practice: Use adjacency-lists representation.**

- Algorithms based on iterating over vertices adjacent to  $v$ .
- Real-world graphs tend to be **sparse**.

← huge number of vertices,  
small average vertex degree

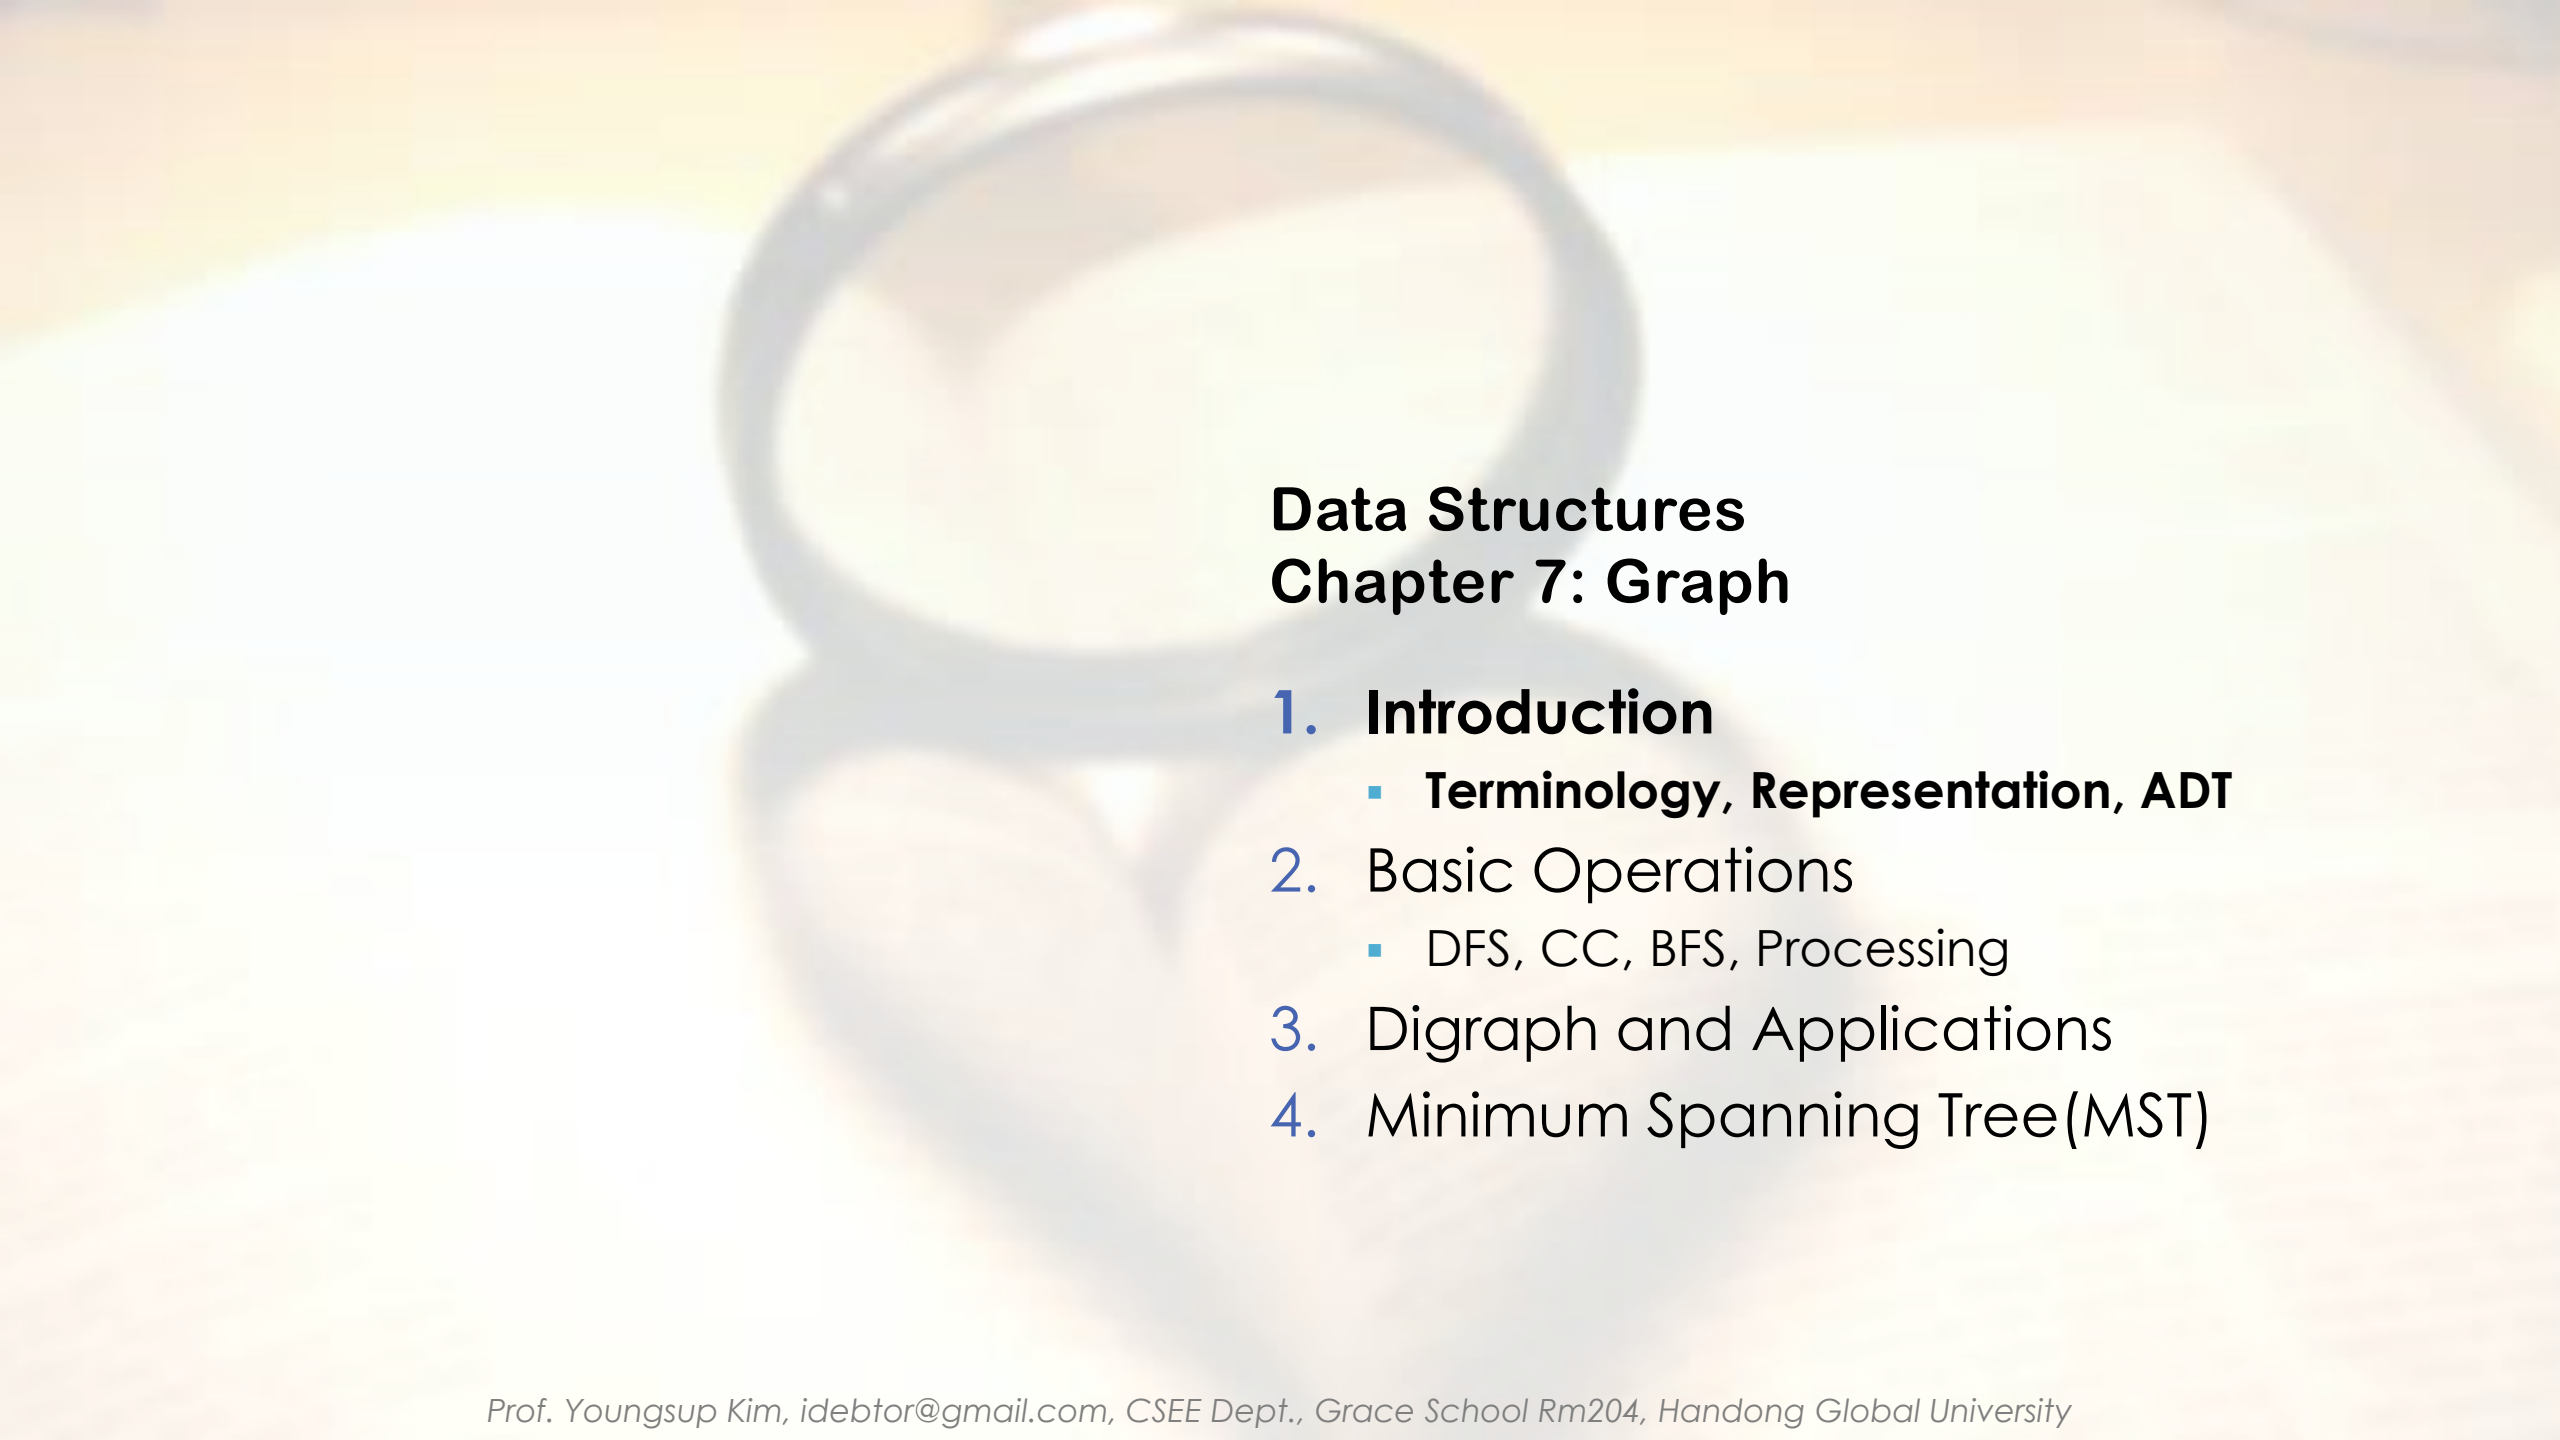

# Graph Coding – Adjacency-matrix 인접행렬

**In practice: Use adjacency-lists representation.**

- Algorithms based on iterating over vertices adjacent to  $v$ .
- Real-world graphs tend to be **sparse**.

← huge number of vertices,  
small average vertex degree

representation	space	add edge	edge between $v$ and $w$ ?	iterate over vertices adjacent to $v$ ?
list of edges	$E$	1	$E$	$E$
adjacency matrix	$V^2$	1	1	$V$
adjacency lists	$E + V$	1	$degree(v)$	$degree(v)$

A pair of glasses with a dark frame and light-colored lenses is resting on a piece of white paper. The background is a soft, out-of-focus yellow and orange gradient.
